Description

The traditional R array has extents which are indexed with integers that start at 1. This is generalized to arbitrary offsets, where extent $i$ is indexed with integers that start at offset[$i$], which must be no less than zero to accommodate the R convention of dropping components with negative indices. In order to use negative offsets, the flag drop.negative can be set FALSE.
Usage

```r
Oarray(data=NA, dim=length(data), dimnames=NULL, offset=rep(1, length(dim)),
       drop.negative=TRUE)
as.Oarray(x, offset=rep(1, length(dim)), drop.negative=TRUE)
## S3 method for class 'Oarray'
as.array(x, ...)
## S3 method for class 'Oarray'
print(x, ...)
```

Arguments

- `data`, `dim`, `dimnames`, `drop`  
  As in the function `array`
- `offset`  
  Vector of first index values for each extent (defaults to 1s); a length-one argument will be silently recycled to the appropriate length
- `drop.negative`  
  Should negative subscripts indicate exclusion?
- `x`  
  An array, possibly of class ‘Oarray’
- `...`  
  Additional arguments to `print` or `as.array()`

Details

Typical uses are

```r
x[i, j]
x[i, j] <- someValues
```

where `x` is an object of class ‘Oarray’ and `i, j` are indices specifying which elements to extract or replace.

Indexing may be via a logical matrix, which indicates which elements to select.

Indexing may be via a single numeric matrix with the one column for each dimension: the offset is `sweep()`-ed out. See `Extract.Rd` for details.

The use of `drop.negative = FALSE` will only work in `.Oarray` where it is provided as the final argument inside the square brackets.

Value

Typically an array, either with or without the ‘Oarray’ class attribute. Extracting from an ‘Oarray’ object unclasses the result which is then a simple array, but assigning into an ‘Oarray’ object leaves the result as an ‘Oarray’ object.

The print method provides more informative extent labelling in the case where dimnames are not provided.

Side effects

The function `base::as.array` is redefined as generic, to provide an `as.array.Oarray` method.

Examples

fred <- oarray(1:24, 2:4, list("sad", "happy"), NULL, NULL,
               offset=rep(7, 3))

tmp <- as.array(fred)
fred1 <- as.oArray(tmp, offset=rep(7, 3))
stopifnot(identical(fred, fred1))

print.default(fred) # print method provides numbers for
# non-named extents

# examples of extraction
fred[] # unclasses fred
fred["sad", 7, -9]
fred["sad", 7, -9, drop=FALSE]
fred[-8, , 7:8]

i <- 8:9; fred[, , i+1]
how.I.feel <- "happy"; fred[how.I.feel, , -(7:8)]

# examples of assignment
fred["sad", 7, -9] <- NA
fred[, , i] <- 100
fred[how.I.feel, , -(7:8)] <- Inf

# now use negative offsets and suppress usual behaviour
fred <- oarray(24:1, 2:4, offset=c(-1, -2, 7), drop.negative=FALSE)
fred[] <- 1:24
fred[-(1:0), , 7:8]
fred[:(1:0), , 7:8] <- 100
dimnames(fred) <- list(c("sad", "happy"), NULL, NULL)
fred["sad", -2, 10] <- NA

# array and logical indexing
a <- oarray(0, dim=rep(2,4), offset=rep(0,4))
a[diag(4)] <- 1
a[a == 0] <- NA
