Package ‘alr4’

February 19, 2015

Version 1.0.5
Date 2014/9/26
Title Data to accompany Applied Linear Regression 4rd edition
Author Sanford Weisberg <sandy@umn.edu>
Maintainer Sanford Weisberg <sandy@umn.edu>
Depends R (>= 2.1.1), car, effects
LazyData yes
Description This package is a companion to the textbook S. Weisberg (2014), "Applied Linear Regression," 4rd edition, Wiley. It includes all the data sets discussed in the book and one function to access the textbook’s website. This package depends on the car package. Many data files in this package are included in the alr3 package as well, so only one of them should be loaded.
License GPL (>= 2)

Description

This package accompanies S. Weisberg, Applied Regression Regression, Fourth Edition, Wiley, 2014. Associated functions have been moved to the car and effects packages.

Details

- **Package**: alr4
- **Version**: 1.0.0
- **Date**: 2013/01/03
- **Depends**: R (>= 2.1.1), car, effects
- **License**: GPL (>= 2)

Author(s)

Sanford Weisberg <sandy@umn.edu>
Description

Data on 102 male and 100 female athletes collected at the Australian Institute of Sport.

Format

This data frame contains the following columns:

- **Sex** (0 = male or 1 = female)
- **Ht** height (cm)
- **Wt** weight (kg)
- **LBM** lean body mass
- **RCC** red cell count
- **WCC** white cell count
- **Hc** Hematocrit
- **Hg** Hemoglobin
- **Ferr** plasma ferritin concentration
- **BMI** body mass index, weight/(height)**2
- **SSF** sum of skin folds
- **Bfat** Percent body fat
- **Label** Case Labels
- **Sport** Sport

Source

Ross Cunningham and Richard Telford

Examples

head(ais)
**allshoots**

---

### allshoots

*Apple shoots data*

---

**Description**

Bland’s Apple Shoot data. allshoots includes all the data, shortshoots just the short shoot data, and longshoots includes long shoots only.

**Format**

This data frame contains the following columns:

- **Day**: days from dormancy
- **n**: number of shoots sampled
- **ybar**: average number of stem units
- **SD**: within-day standard deviation
- **Type**: 1 if long shoots, 0 if short shoots.

**Source**

**References**

**Examples**

```r
head(longshoots)
```

---

### alr4Web

*Access to the Applied Linear Regression website*

---

**Description**

These function will access the website for Applied Linear Regression, 3rd and 4th editions.

**Usage**

```r
alr4Web(page = c("webpage", "errata", "primer", "solutions"))
```
Arguments

page A character string indicating what page to open. The default "webpage" will open the main webpage, "errata" displays the Errata sheet for the third edition of the book, "primer" fetches and displays the primer for R, and "solutions" gives solutions to odd-numbered problems.

Value

Either a webpage or a pdf document is displayed. This function gives quick access to the website for the book and in particular to the R primer and solutions to odd-numbered problems. The pdf files are formatted for viewing on a computer screen. With Adobe Reader, view the pdf files with the bookmarks showing at the left, using single page view which is selected by View -> Page Display -> Single Page View.

Author(s)

Sanford Weisberg, based on the function UsingR in the UsingR package by John Verzani

Examples

```r
## Not run: alr4Web("primer")
```

---

**baeskel**

**Surface tension**

Description

The data in the file were collected in a study of the effect of dissolved sulfur on the surface tension of liquid copper (Baes and Kellogg, 1953)

Format

This data frame contains the following columns:

- **Sulfur** Weight percent sulfur
- **Tension** Decrease in surface tension, dynes/cm

Source

References

**BGSall**

**Examples**

```r
head(baeskel1)
```

---

**BGSall** *Berkeley guidance study*

---

**Description**

Data from the Berkeley guidance study of children born in 1928-29 in Berkeley, CA. BGSall contains all the data, BGSboys the boys only, and BGSgirls the girls only.

**Format**

This data frame contains the following columns:

- **Sex** 0 = males, 1 = females
- **WT2** Age 2 weight (kg)
- **HT2** Age 2 height (cm)
- **WT9** Age 9 weight (kg)
- **HT9** Age 9 height (cm)
- **LG9** Age 9 leg circumference (cm)
- **ST9** Age 9 strength (kg)
- **WT18** Age 18 weight (kg)
- **HT18** Age 18 height (cm)
- **LG18** Age 18 leg circumference (cm)
- **ST18** Age 18 strength (kg)
- **BMI18** Body Mass Index, \( \text{WT18} / (\text{HT18} / 100)^2 \), rounded to one decimal.
- **Soma** Somatotype, a 1 to 7 scale of body type.

**Source**

**References**

BigMac2003  

World cities data  

Description

Prices in many world cities from a 2003 Union Bank of Switzerland report.

Format

This data frame uses the name of the city as row names, and contains the following columns:

- **BigMac**  Minutes of labor to purchase a Big Mac
- **Bread**  Minutes of labor to purchase 1 kg of bread
- **Rice**  Minutes of labor to purchase 1 kg of rice
- **FoodIndex**  Food price index (Zurich=100)
- **Bus**  Cost in US dollars for a one-way 10 km ticket
- **Apt**  Normal rent (US dollars) of a 3 room apartment
- **TeachGI**  Primary teacher’s gross income, 1000s of US dollars
- **TeachNI**  Primary teacher’s net income, 1000s of US dollars
- **TaxRate**  Tax rate paid by a primary teacher
- **TeachHours**  Primary teacher’s hours of work per week:

**Blowdown data, Black Spruce only**

**Description**
Data from the Boundary Waters Canoe Area Wilderness Blowdown. The data frame `blowdown` includes nine species of trees, but this file only includes black spruce, grouped by diameter.

**Format**
This data frame contains the following columns:

- **d** Tree diameter, in cm
- **died** Number of trees of this value of d that died (blowdown)
- **m** number of trees of this size class measured

**Source**
Roy Rich

**References**

**Examples**

head(Blowdown)
```

**Blowdown data**

**Description**
Data from the Boundary Waters Canoe Area Wilderness Blowdown. The data frame `blowdown` includes nine species of trees. The data for balsam fir, summarized by diameter class, are given in `blowBF`.

**Format**
This data frame contains the following columns:

- **d** Tree diameter, in cm
- **s** Proportion of basal area killed for the four species balsam fir, cedar, paper birch and blue spruce, a measure of local severity of the storm.
- **spp** Tree species, a factor with 9 levels
- **y** 1 if the tree died, 0 if it survived

Cakes data

Description
Oehlert (2000, Example 19.3) provides data from a small experiment on baking packaged cake mixes.

Format
A data frame with 14 observations on the following 4 variables.

- **block** a factor
- **X1** Baking time, minutes
- **X2** Baking temperature, degrees F
- **Y** Palatability score

Source

References

Examples

Challenger data

Description

Contains data from the performance of O-rings in 23 U.S. space shuttle flights prior to the Challenger disaster of January 20, 1986.

Format

This data frame uses dates as row names and contains the following columns:

- **temp** Air Temp at launch (degrees F)
- **pres** Leak check pressure
- **fail** Number of O-rings that failed
- **n** 6, number of O-rings in launch
- **erosion** Number of erosion incidents
- **blowby** Number of blowby incidents
- **damage** Total Damage Index

cloud  

*Florida area cumulus experiment, FACE I.*  

**Description**  
The data summarize the results of the first Florida Area Cumulus Experiment, or FACE-1, designed to study the effectiveness of cloud seeding to increase rainfall in a target area (Woodley, Simpson, Biondini, and Berkley, 1977).

**Format**  
This data frame contains the following columns:

- **A**  Action, 1=seed, 0=do not seed
- **D**  Day after June 16, 1975
- **S**  Suitability for seeding
- **C**  percent cloud cover in experimental area, measured using radar in Coral Gables, Florida
- **P**  $10^7 m^3$ prewetness
- **E**  echo motion category, either 1 or 2, a measure for type of cloud
- **Rain**  $10^7 m^3$ in target area

**Source**  

**References**  

**Examples**  
head(cloud)

domedata  

*Metrodome fan experiment*  

**Description**  
These files give the results of two experiments to see if manipulating the air conditioning fans in the Minneapolis metrodome can effect the distance travelled by a baseball. The data in domedata were collected in April 2003. The experiment was repeated in May 2003 and domedata1 gives the combined data from the two experiments.
Format
A data frame with 96 observations on the following 7 variables.

Date  a factor with levels March- May
Cond  a factor with levels Headwind, Tailwind
Angle the actual angle
Velocity in feet per second
BallWt weight of ball in grams
BallDia diameter of ball in inches
Dist  distance in feet of the flight of the ball

Donner  Donner party

Description
The Donner Party was the most famous tragedy in the history of the westward migration in the United States. In the winter of 1846-47, about ninety wagon train emigrants were unable to cross the Sierra Nevada Mountains of California before winter, and almost one-half starved to death. Perhaps because they were ordinary people – farmers, merchants, parents, children. These data include some information about each of the members of the party from Johnson (1996).

Format
This data frame uses the person’s name as row labels and contains the following columns:

age  Approximate age in 1846
y    died or survived, a factor
sex  Male or Female
family.name Either a family name, hired or single
status A factor with levels Family, Single or Hired
Source

References

Examples

```r
head(Donner)

Description

For unknown reasons, some dairy cows become recumbant—they lay down. This condition can be serious, and may lead to death of the cow. These data are from a study of blood samples of over 500 cows studied at the Ruakura (N.Z.) Animal Health Laboratory during 1983-84. A variety of blood tests were performed, and for many of the animals the outcome (survived, died, or animal was killed) was determined. The goal is to see if survival can be predicted from the blood measurements. Case numbers 12607 and 11630 were noted as having exceptional care—and they survived.

Format

This data frame contains the following columns:

- **calving** a factor with levels before and after
- **daysrec** Days recumbent
- **ck** Serum creatine phosphokinase (U/l at 30C)
- **ast** serum asparate amino transferase (U/l at 30C)
- **urea** serum urea (mmol/l)
- **pcv** Packed Cell Volume (Haemactocrit),
- **inflamat** inflammation 0=no, 1=yes
- **myopathy** Muscle disorder, a factor with levels present, and absent
- **outcome** a factor with levels died and survived

head(drugcost)

drugcost

<table>
<thead>
<tr>
<th>Drug cost.</th>
</tr>
</thead>
</table>

**Description**

These data are to try to understand the effect of health plan characteristics on drug costs. Health plans vary in size, given as member months. Some plans use generic drugs more than others. All differ on copayments. Some have strong restrictions on which drugs can be dispensed value of RI=0 means that all drugs are dispensed, RI=100 means that only one per category is available. The goal is to determine the terms that are related to cost, and in particular to understand the role of GS and RI in determining cost.

**Format**

This data frame uses a short code name for the drug plan as row labels and contains the following columns:

- **COST** Ave. cost to plan for 1 prescription for 1 day
- **RXPM** Number of prescriptions per member per year
- **GS** Percent generic substitution, number between 0 (no substitution) to 100 (always use generic substitute)
- **RI** Restrictiveness index (0=none, 100=total)
- **COPAY** Average Rx copayment
- **AGE** Average age of member
- **F** Percent female members
- **MM** Member months, a measure of the size of the plan

head(drugcost)
Description

An experiment was conducted to study the O2UP, oxygen uptake in milligrams of oxygen per minute, given five chemical measurements: biological oxygen demand (BOD), total Kjeldah nitrogen (TKN), total solids (TS), total vital solids (TVS), which is a component of TS, and chemical oxygen demand (COD), each measured in milligrams per liter (Moore, 1975).

Format

This data frame contains the following columns:

- **Day**: Day number
- **BOD**: Biological oxygen demand
- **TKN**: Total Kjeldahl nitrogen
- **TS**: Total Solids
- **TVS**: Total volatile solids
- **COD**: Chemical oxygen demand
- **O2UP**: Oxygen uptake

galapagos

Galapagos species data

Description

Johnson and Raven (1973) have presented data giving the number of species and related variables for 29 different islands in the Galapagos Archipelago.

Format

This data frame uses the island name as row labels and contains the following columns:

- **NS** Number of Species
- **ES** Number of endemic species (occur only on that island)
- **Area** Surface area of island, hectares
- **Anear** Area of closest island, hectares
- **Dist** Distance to closest island, km
- **DistSC** Distance from Santa Cruz Island, km
- **Elevation** Elevation in m, missing values given as zero
- **EM** 1 if elevation is observed, 0 if missing

Source

In a paper presented to the Royal Institute on February 9, 1877, Sir Francis Galton discussed his experiments on sweet peas in which he compared the sweet peas produced by parent plants to those produced by offspring plants. In these experiments he could observe inheritance from one generation to the next. Galton categorized the parent plants according to the typical diameter of the peas they produced.

### Format

This data frame contains the following columns:

- **Parent**  mean diameter of parent
- **Progeny** mean diameter of offspring
- **SD** offspring standard deviation

**Highway heights**

**Pearson-Lee data**

**Description**

Karl Pearson organized the collection of data on over 1100 families in England in the period 1893 to 1898. This particular data set gives the Heights in inches of mothers and their daughters, with up to two daughters per mother. All daughters are at least age 18, and all mothers are younger than 65. Data were given in the source as a frequency table to the nearest inch. Rounding error has been added to remove discreteness from graph.

**Format**

This data frame contains the following columns:

- **mheight** Mother’s ht, in.
- **dheight** Daughter’s ht, in.

**Source**

**References**

**Highway**

**Highway accidents**

**Description**

The data comes from an unpublished master’s paper by Carl Hoffstedt. They relate the automobile accident rate, in accidents per million vehicle miles to several potential terms. The data include 39 sections of large Highways in the state of Minnesota in 1973. The goal of this analysis was to understand the impact of design variables, acpts, slim, Sig, and shld that are under the control of the Highway department, on accidents.
Format

This data frame contains the following columns:

- **adt**: Average daily traffic count in thousands
- **trks**: Truck volume as a percent of the total volume
- **lane**: Total number of lanes of traffic
- **acpt**: Number of access points per mile
- **sigs**: Number of signalized interchanges per mile
- **itg**: Number of freeway-type interchanges per mile
- **slim**: Speed limit in 1973
- **len**: Length of the Highway segment in miles
- **lwid**: Lane width, in feet
- **shld**: Width in feet of outer shoulder on the roadway
- **htype**: An indicator of the type of roadway or the source of funding for the road; "mc" for major collector, "fai" for Federal interstate highways, "pa" for principal arterial highway, and "ma" for major arterial highways
- **rate**: 1973 accident rate per million vehicle miles

Description

In a study of coinage, W. Stanley Jevons weighed 274 gold sovereigns that he had collected from circulation in Manchester, England. For each coin, he recorded the weight, after cleaning, to the nearest .001 gram, and the date of issue. The age classes are coded 1 to 5, roughly corresponding to the age of the coin in decades. The standard weight of a gold sovereign was supposed to be 7.9876 grams; minimum legal weight was 7.9379 grams.

Format

This data frame contains the following columns:

- **Age** Age of coins, decades
- **n** Number of coins
- **Weight** Average weight, grams
- **SD** Standard deviation.
- **Min** Minimum weight
- **Max** Maximum weight

World records for the mile run

Description

World record times for the mile run, 1861–2003.

Format

A data frame with 46 observations:

- **Year**  Year in which the record was set
- **Time**  Running time, in seconds
- **Name**  Name of person setting the record
- **Country**  Country of residence of the record setter
- **Place**  Place the record was set
- **Gender**  Gender of the record holder

References

Description

These data include nearly every farm sale in 6 economic regions in Minnesota from 2002-2011 that either has land enrolled in the federal Conservation Reserve Program, or CRP, or has no restrictions. A few sales with non-crp land easements were excluded. CRP enrollment is for a fixed period during which farmers agree not to grow crops for a fixed payment. This can effect sale price of land since buyers have fewer choices on use of land that could lower values, but also have guaranteed income for a fixed period that could raise values.

Usage

data(MinnLand)

Format

A data frame with 18700 observations on the following 10 variables.

acrePrice sale price in dollars per acre. Sale prices were adjusted to a common date within the year. No inflation adjustment is made between years.

region a factor with levels giving the geographic names of six economic regions of Minnesota. Excluded economic regions had few farm sales.

improvements percentage of property value due to improvements. Minnesota assessors estimate values separately for land and buildings. This variable is the ratio of the building value to the total value.

year year of sale, as a continuous variable, not as a factor. Most uses of this variable would require converting it to a factor.

acres size of the farm in acres

tillable percentage of farm acreage that is rated arable by the assessor

financing a factor with levels title transfer and seller finance

crpPct the percentage of all farm acres enrolled in CRP

productivity average agronomic productivity scaled 1 to 100, with larger numbers for more productive land. This score is based on University of Minnesota soil studies. This value is frequently missing because some counties never had the study done, and some county assessors are inconsistent in including this value in the record of the sale.

Details

Data is collected from Minnesota counties. Some counties do not include the productivity value in sales records, accounting for most of the missing values. The variable tillable is also frequently missing.

Description

The Alaska pipeline data consists of in-field ultrasonic measurements of the depths of defects in the Alaska pipeline. The depth of the defects were then re-measured in the laboratory. These measurements were performed in six different batches. The data were analyzed to calibrate the bias of the field measurements relative to the laboratory measurements. In this analysis, the field measurement is the response variable and the laboratory measurement is the predictor variable.

These data were originally provided by Harry Berger, who was at the time a scientist for the Office of the Director of the Institute of Materials Research (now the Materials Science and Engineering Laboratory) of NIST. These data were used for a study conducted for the Materials Transportation Bureau of the U.S. Department of Transportation.

Format

This data frame contains the following columns:

- **Field**: Number of defects measured in the field.
- **Lab**: Number of defects measured in the field.
- **Batch**: Batch number

Description

Soil productivity scores for farms in townships in four counties in the Minneapolis St. Paul metropolitan area, 1981-82. The goal is to see if the productivity score is a good predictor of the assessed value of the farmland. If so, then productivity score could be used to set assessed value for farms enrolled in the “green acres” program that requires that urban farmland be taxed at its agricultural value only without regard to development potential.
**Format**

This data frame contains the following columns:

- **County** Name of the county
- **Value** Assessed value in dollars per acre.
- **P** Productivity score, a number between 1 and 100.
- **Year** Tax year, either 1981 or 1982.

### Rat data

**Description**

Data collected in an experiment in which rats were injected with a dose of a drug approximately proportional to body weight. At the end of the experiment, the animal’s liver was weighed, and the fraction of the drug recovered in the liver was recorded. The experimenter expected the response to be independent of the predictors.

**Format**

This data frame contains the following columns:

- **BodyWt** BodyWt of the rat
- **LiverWt** LiverWt measured after sacrifice
- **Dose** Dose, roughly proportional to body weight
- **y** dose of drug recovered after sacrifice of the animal

Rateprof  
Professor ratings from RateMyProfessors.com.

Description

These data includes the summaries of the ratings of 364 instructors at one large campus in the Midwest from Bleske-Rechek and Fritsch (2011). Each instructor included in the data had at least 10 ratings over a several year period. Students provided ratings on 5 point scales. The data file provides the averages ratings and additional characteristics of the instructors.

Format

A data frame with 364 observations on the following 17 variables.

gender  instructor gender, a factor with levels female male
numYears  a numeric vector, number of years in which this instructor had ratings between 1999 and 2009.
numRaters  number of ratings
numCourses  number of different course titles included in the rating for this instructor
pepper  a factor with levels no and yes. In addition to rating for quality, instructors are rated as attractive or not. A value of yes means that the consensus is that the instructor is attractive.
discipline  a factor with levels Hum for humanities, SocSci for social sciences, STEM for science, technology, engineering and mathematics and Pre-prof for professional training
quality  Average quality rating, between 1, worst, to 5, best
helpfulness  Average helpfulness rating, between 1, worst, to 5, best
clarity  Average clarity rating, between 1, worst, to 5, best
easiness  Average easiness rating, between 1, worst, to 5, best
raterInterest  Average rater interest, between 1, lowest, to 5, highest
sdQuality  SD of quality rating
sdHelpfulness  SD of helpfulness rating
sdClarity  SD of clarity rating
sdEasiness  SD of easiness rating
sdRaterInterest  SD of rater interest

Examples

head(stevens)

Stevens  Subjective scaling data collected by S. S. Stevens

Description

This experiment was apparently done by S. S. Stevens and colleagues in March 1962, although the exact reference is lost. 10 subjects were played tones at each of 5 loudnesses, presumably in random order. Subjects were asked to draw a line on paper whose length matched the loudness of the tone. Each subject repeated each loudness 3 times, for a total of 30 trials per subject. The original data are lost; reported here is the mean of the 3 log-lengths for each loudness, the sd of the three log-lengths, and the number of replications, which is always 3.

Usage

data(stevens)

Format

A data frame with 50 observations on the following 5 variables.

subject  a factor with unique values for each subject
loudness either 50, 60, 70, 80 or 90 db. Decibels are a logarithmic scale
y  a numeric vector giving the mean of the log-lengths of three lines drawn. Exponentiating these values would give the geometric mean of the three lengths in cm.
sd a numeric vector, giving the sd of the three log lengths
n  a numeric vector, equal to the constant value 3

Details

This is a classic example of a psychophysics experiment pioneered by S. S. Stevens. The basic idea is that the psychological response y to a physical stimulus x should be proportional to x to a power. Since both the response and the loudness are already in log-scale, linear fits should be expected.
Source

These data were obtained in the early 1970s from the data library in the Harvard University Statistics Department.
