as.data.frame.BayesMfp

Convert a BayesMfp object to a data frame

Description

Convert the BayesMfp object to a data frame with the saved models.

Usage

```r
## S3 method for class 'BayesMfp'
as.data.frame(x, row.names = NULL, ..., freq = TRUE)
```

Arguments

- `x`: valid BayesMfp object
- `row.names`: optional rownames (default is to keep the names of the BayesMfp list)
- `freq`: should empirical frequencies of the models in the sampling path be given? (default)
- `...`: unused

Author(s)

Daniel Sabanès Bové

BayesMfp

Examples

```r
## generate a BayesMfp object
set.seed(19)
x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
y <- rt(n=15, df=2)
test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels = 100,
               method="exhaustive")

## get the models data frame
as.data.frame(test)
```

BayesMfp

Bayesian model inference for multiple fractional polynomial models

Description

Bayesian model inference for multiple fractional polynomial models is conducted by means of either exhaustive model space evaluation or posterior model sampling.

Usage

```r
BayesMfp(formula = formula(data), data = parent.frame(), family =
  gaussian, priorSpecs = list(a = 4, modelPrior = "flat"), method =
  c("ask", "exhaustive", "sampling"), subset = NULL, na.action = na.omit,
  verbose = TRUE, nModels = NULL, nCache=1e9L, chainlength = 1e5L)

bfp(x, max = 2, scale = TRUE, rangeVals=NULL)

uc(x)
```

Arguments

- **formula**: model formula
- **data**: optional data.frame for model variables (defaults to the parent frame)
- **family**: distribution and link: only gaussian("identity") supported at the moment
- **priorSpecs**: prior specifications, see details
- **method**: which method should be used to explore the posterior model space? (default: ask the user)
- **subset**: optional subset expression
- **na.action**: default is to skip rows with missing data, and no other option supported at the moment
BayesMfp

verbose should information on computation progress be given? (default)
nModels how many best models should be saved? (default: 1% of the explored models or
the chainlength, 1 would mean only the maximum a posteriori [MAP] model)
nCache maximum number of best models to be cached at the same time during the model
sampling (only has an effect if sampling has been chosen as method)
chainlength length of the model sampling chain (only has an effect if sampling has been
chosen as method)
x variable
max maximum degree for this FP (default: 2)
scale use pre-transformation scaling to avoid numerical problems? (default)
rangeVals extra numbers if the scaling should consider values in this range. Use this argu-
ment if you have test data with larger range than the training range.

Details

The formula is of the form \( y \sim bfp(x_1, \text{max} = 4) + uc(x_2 + x_3) \), that is, the auxiliary
functions \( bfp \) and \( uc \) must be used for defining the fractional polynomial and uncertain fixed form
covariates terms, respectively. There must be an intercept, and no other fixed covariates are allowed.
All \( \text{max} \) arguments of the \( bfp \) terms must be identical.

The prior specifications are a list:

- **a** hyperparameter for hyper-g prior which must be greater than 3 and is recommended to be not
greater than 4 (default is 4)

- **modelPrior** choose if a flat model prior (default, "flat"), a model prior favoring sparse models
explicitly ("sparse"), or a dependent model prior ("dependent") should be used.

If method = "ask", the user is prompted with the maximum cardinality of the model space and can
then decide whether to use posterior sampling or the exhaustive model space evaluation.

Note that if you specify only one FP term, the exhaustive model search must be done, due to the
structure of the model sampling algorithm. However, in reality this will not be a problem as the
model space will typically be very small.

Value

Returns an object of class BayesMfp that inherits from list. It is essentially a list of models. Each
model is a list and has the following components:

- **powers** a list of numeric vectors, where each vector contains the powers of the covariate
  that its name denotes.

- **ucTerms** an integer vector of the indices of uncertain fixed form covariates that are present
  in the model.

- **logM** log marginal likelihood

- **logP** log prior probability

- **posterior** normalized posterior probability, and if model sampling was done, the frequency
  of the model in the sampling algorithm
BayesMfp

postExpectedg  posterior expected covariance factor g
postExpectedShrinkage  posterior expected shrinkage factor t=g/(g + 1)
R2  usual coefficient of determination for the linear model

Subsetting the object with [.BayesMfp returns again a BayesMfp object with the same attributes, which are

numVisited  the number of models that have been visited (exhaustive search) or cached (model sampling)
inclusionProbs  BMA inclusion probabilities for all uncertain covariates
linearInclusionProbs  BMA probabilities for exactly linear inclusion of FP covariates
logNormConst  the (estimated) log normalizing constant f(D)
chainlength  length of the Markov chain, only present if method = "sampling"
call  the original call
formula  the formula by which the appropriate untransformed design matrix can be extracted
x  the shifted and scaled design matrix for the data
xCentered  the column-wise centered x
y  the response vector
yMean  the mean of the response values
SST  sum of squares total
indices  a list with components that describe the positions of uncertain covariate groups, fractional polynomial terms and fixed variables in the design matrix
termNames  a list of character vectors containing the names of uncertain covariate groups, fractional polynomial terms and fixed variables
shiftScaleMax  matrix with 4 columns containing preliminary transformation parameters, maximum degrees and cardinalities of the power sets of the fractional polynomial terms
priorSpecs  the utilized prior specifications
randomSeed  if a seed existed at function call (get(".Random.seed", .GlobalEnv)), it is saved here

Note

logNormConst may be unusable due to necessary conversion from long double to double!

Various methods for posterior summaries are available.

BayesMfp Methods, BmaSamples
BayesMfp Methods

Examples

```r
## generate some data
set.seed(19)

x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)

y <- rt(n=15, df=2)

## run an exhaustive model space evaluation with a flat model prior and
## a uniform prior (a = 4) on the shrinkage factor \( t = \frac{1}{1 + g} \):

test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels = 100,
                   method = "exhaustive")

## now the same with a *dependent* model prior:

priorSpecs = list(a = 4, modelPrior = "dependent"),
               method = "exhaustive")

test2
```

BayesMfp Methods

Other methods for BayesMfp objects

Description

Print the object (print), get fitted values (fitted) and corresponding residuals (residuals).

Usage

```r
## S3 method for class 'BayesMfp'
print(x, ...)
## S3 method for class 'BayesMfp'
fitted(object, design = getDesignMatrix(object), post =
        getPosteriorParms(object, design = design), ...)
## S3 method for class 'BayesMfp'
residuals(object, ...)
```

Arguments

- `x`: valid `BayesMfp` object
- `object`: valid `BayesMfp` object, only the first model will be used.
- `design`: design matrix of the first model in the object, which can be supplied by the caller if it is computed beforehand
- `post`: posterior parameters of the normal-gamma distribution (defaults to the posterior expected mean, marginalized over the covariance factor g)
- `...`: unused

bmaPredict

BMA prediction for new data points

Description

Make a Bayesian model averaged prediction for new data points, from those models saved in a BayesMfp object.

Usage

bmaPredict(BayesMfpObject, postProbs = posterioriors(BayesMfpObject), newdata)

Arguments

BayesMfpObject
BayesMfp object with the models over which the predictions should be averaged

postProbs
vector of posterior probabilities, which are then normalized to the weights of the model average (defaults to the normalized posterior probability estimates)

newdata
new covariate data as data.frame
**Value**

The predicted values as a vector.

**Note**

Note that this function is not an S3 predict method for `BmaSamples` objects, but a function working on `BayesMfp` objects (because we do not need BMA samples to do BMA point predictions).

**Author(s)**

Daniel Sabanès Bové

**See Also**

`BmaSamples` Methods

**Examples**

```r
## generate a BayesMfp object
set.seed(19)

x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)

y <- rt(n=15, df=2)

test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels = 100, method="exhaustive")

## predict new responses at (again random) covariates
bmaPredict(test,
   newdata = list(x1 = rnorm(n=15),
                  x2 = rbinom(n=15, size=5, prob=0.2) + 1,
                  x3 = rexp(n=15)))
```

---

**BmaSamples**

*Bayesian model averaging over multiple fractional polynomial models*

**Description**

Draw samples from the Bayesian model average over the models in saved in a `BayesMfp`-object.

**Usage**

```r
BmaSamples(object, sampleSize = length(object) * 10, postProbs = posteriors(object), gridList = list(), gridSize = 203, newdata=NULL, verbose = TRUE, includeZeroSamples=FALSE)
```
**Arguments**

- **object**: valid `BayesMfp` object containing the models over which to average
- **sampleSize**: sample size (default is 10 times the number of models)
- **postProbs**: vector of posterior probabilities (will be normalized within the function, defaults to the normalized posterior probabilities)
- **gridList**: optional list of appropriately named grid vectors for FP evaluation, default is a length (gridSize - 2) grid per covariate additional to the observed values (two are at the minimum and maximum)
- **gridSize**: see above (default: 203)
- **newdata**: new covariate data.frame with exactly the names (and preferably ranges) as before (default: no new covariate data)
- **verbose**: should information on sampling progress be printed? (default)
- **includeZeroSamples**: should the function and coefficient samples include zero samples, from models where these covariates are not included at all? (default: FALSE, so the zero samples are not included)

**Value**

Return an object of class `BmaSamples`, which is a list with various elements that describe the `BayesMfp` object over which was averaged, model frequencies in the samples, the samples themselves etc:

- **priorSpecs**: the utilized prior specifications
- **termNames**: a list of character vectors containing the names of uncertain covariate groups, fractional polynomial terms and fixed variables
- **shiftScaleMax**: matrix with 4 columns containing preliminary transformation parameters, maximum degrees and cardinalities of the powersets of the fractional polynomial terms
- **y**: the response vector
- **x**: the shifted and scaled design matrix for the data
- **randomSeed**: if a seed existed at function call (`get(".Random.seed", .GlobalEnv)`), it is saved here
- **modelFreqs**: The table of model frequencies in the BMA sample
- **modelData**: data frame containing the normalized posterior probabilities of the models in the underlying `BayesMfp` object, corresponding log marginal likelihoods, model prior probabilities, posterior expected covariance and shrinkage factors, coefficients of determination, powers and inclusions, and finally model average weights and relative frequencies in the BMA sample.
- **sampleSize**: sample size
- **sigma2**: BMA samples of the regression variance
- **shrinkage**: BMA samples of the shrinkage factor
- **fixed**: samples of the intercept
bfp

named list of the FP function samples, where each element contains one FP covariate and is a matrix (samples x grid), with the following attributes:

**whereObsVals** where in the scaled grid are the originally observed covariate values? (integer vector of the indexes)

**scaledGrid** numeric vector with the positions of the scaled grid points, corresponding to the columns of the samples matrix

**counter** how often has this covariate been included in the BMA sample? (identical to the number of rows in the samples matrix)

uc

named list of the uncertain fixed form covariates, where each element contains the coefficient samples of one group: in a matrix with the attribute counter as number of samples in the rows, and the columns are appropriately named to correspond to the single design variables.

fitted

fitted values of all models in object, in a matrix with layout models x observations.

predictions

samples from the predictive distribution at the covariates given in newdata

predictMeans

means of the predictive distribution at the covariates given in newdata

BmaSamples Methods, BayesMfp

Examples

```r
## construct a BayesMfp object
set.seed(19)

x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
y <- rt(n=15, df=2)

test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels = 200, method="exhaustive")

## now draw samples from the Bayesian model average
testBma <- BmaSamples(test)
testBma

## We can also draw predictive samples for new data points, but then
## we need to supply the new data to BmaSamples:
newdata <- data.frame(x1 = rnorm(15),
                    x2 = rbinom(n=15, size=5, prob=0.2) + 1,
                    x3 = rexp(n=15))
testBma <- BmaSamples(test, newdata=newdata)
predict(testBma)

## test that inclusion of zero samples works
testBma <- BmaSamples(test, includeZeroSamples=TRUE)
testBma
```
**BmaSamples Methods**

*Other methods for BmaSamples objects*

---

**Description**

Print the object (`print`), get fitted values (`fitted`) and corresponding residuals (`residuals`).

**Usage**

```r
## S3 method for class 'BmaSamples'
print(x, ...)
## S3 method for class 'BmaSamples'
fitted(object, ...)
## S3 method for class 'BmaSamples'
residuals(object, ...)
```

**Arguments**

- `x`: valid `BmaSamples` object
- `object`: valid `BmaSamples` object
- `...`: unused

**Author(s)**

Daniel Sabanés Bové

```r
## construct a BayesMfp object
set.seed(19)

x1 <- rnorm (n=15)
x2 <- rbinom (n=15, size=20, prob=0.5)
x3 <- rexp (n=15)

y <- rt (n=15, df=2)

test <- BayesMfp (y ~ bfp (x2, max = 4) + uc (x1 + x3), nModels = 200, method="exhaustive")

## now draw samples from the Bayesian model average
testBma <- BmaSamples (test)

## the print method:
testBma
```
Construct an empirical highest posterior density (HPD) interval from samples which have been drawn from the distribution of a quantity of interest.

Usage

empiricalHpd(theta, level)

Arguments

theta the vector of samples
level the credible level

Value

A vector with the estimated lower and upper bounds of the HPD interval.

Author(s)

Daniel Saban\'es Bov\'e

Examples

## draw standard normal variates
test <- rnorm(n=1000)

## estimate the 95\% HPD interval with these samples:
empiricalHpd(theta=test, level=0.95)

## compare with true HPD:
qnorm(p=c(0.025, 0.975))
Extract method for BayesMfp objects

Description

Extract a subset of models from a BayesMfp object.

Usage

```r
## S3 method for class 'BayesMfp'
\[\ldots\]
```

Arguments

- `x`: valid BayesMfp object
- `\ldots`: transports the indexes of the models

Author(s)

Daniel Sabanes Bove

See Also

BayesMfp

Examples

```r
## generate a BayesMfp object
set.seed(19)
x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
y <- rt(n=15, df=2)
test <- BayesMfp(y ~ bfp(x2, max = 4) + uc (x1 + x3), nModels = 100, method="exhaustive")

## extract the top ten models
test[1:10]
```
findModel

Find a specific fractional polynomial model in a BayesMfp object

Description

Returns the index of the wished model if it is present in the model list, and otherwise returns NA.

Usage

findModel(model, BayesMfpObject)

Arguments

model the specific model: a list with entries powers and ucterms
BayesMfpObject an object of class BayesMfp

Details

See BayesMfp for the description of a model.

Value

Index of model in BayesMfpObject if it is present in the model list, otherwise NA.

Note

The searched model must have exactly the same construction as the models in BayesMfpObject. See the example below for the recommended use.

Examples

```r
## construct a BayesMfp object
set.seed(92)

x1 <- rnorm(15)
x2 <- rbinom(n=15, size=20, prob=0.6)
x3 <- rexp(15)
y <- rt(15, df=2)

test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels=2000, method="exhaustive")

## copy one model
myModel <- test[[1]]

## and modify it!
myModel$powers["x2"] <- c(1, 2)
stopifnot(identical(findModel(myModel, test), 31L))
```
getPosteriorParms

Extract updated posterior parameters for the normal inverse gamma distribution from a model, given a shrinkage factor.

Description

Conditional on a fixed shrinkage factor \( t = g/(g+1) \), the posterior joint distribution of the effects and the regression variance is normal inverse gamma. With this function, you can compute the parameters of this distribution.

Usage

```r
getPosteriorParms(x, shrinkage=x[[1]]$postExpectedShrinkage, design = getDesignMatrix(x))
```

Arguments

- `x`: a valid `BayesMfp`-Object, only first list element will be recognized
- `shrinkage`: shrinkage factor used in the computations (defaults to the posterior expected shrinkage factor in the model \( x[1] \))
- `design`: (centered) design matrix for the model

Value

A list with four parameters:

- `aStar`: the first parameter of the inverse gamma distribution
- `vStar`: the covariance matrix part of the multivariate normal distribution
- `mStar`: the expectation of the multivariate normal distribution
- `bStar`: the second parameter of the inverse gamma distribution

Author(s)

Daniel Sabanes Bove

Examples

```r
## construct a BayesMfp object
set.seed(19)

x1 <- rnorm (n=15)
x2 <- rbinom (n=15, size=20, prob=0.5)
x3 <- rexp (n=15)
y <- rt (n=15, df=2)

test <- BayesMfp (y ~ bfp (x2, max = 4) + uc (x1 + x3), nModels = 200, method="exhaustive")
```
## now get the posterior parameters of the third best model
getPosteriorParms(test[3])

---

**inclusionProbs**  
Compute (model averaged) posterior variable inclusion probabilities

**Description**

Compute (model averaged) posterior inclusion probabilities for the uncertain variables (including FP variables) based on a `BayesMfp` object.

**Usage**

```r
inclusionProbs(BayesMfpObject, postProbs = posteriors(BayesMfpObject, ind = 1))
```

**Arguments**

- `BayesMfpObject` valid `BayesMfp` object
- `postProbs` posterior probabilities to weight the models (defaults to the normalized probability estimates)

**Value**

Named numeric vector with the estimated variable inclusion probabilities. Note that these can differ noticeably from the “global” inclusion probabilities computed from all discovered models, from which only the best were saved in the `BayesMfp` object.

**Author(s)**

Daniel Sabanés Bové

**Examples**

```r
## construct a BayesMfp object
set.seed(19)
x1 <- rnorm (n=15)
x2 <- rbinom (n=15, size=20, prob=0.5)
x3 <- rexp (n=15)
y <- rt (n=15, df=2)
test <- BayesMfp (y ~ bfp (x2, max = 4) + uc (x1 + x3), nModels = 200, method="exhaustive")
## now get the local inclusion probabilities
local <- inclusionProbs(test)
## they can be compared with the global inclusion probabilities
local - attr(test, "inclusionProbs")
```
Description

This is the Ozone data discussed in Breiman and Friedman (JASA, 1985, p. 580). These data are for 330 days in 1976. All measurements are in the area of Upland, CA, east of Los Angeles.

Usage

data(ozone)

Format

A data frame with 366 observations on the following 13 variables.

- month: month of the year
- day: day of the month
- weekday: day of the week: a factor with levels Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday
- hourAverageMax: maximum 1-hour average ozone level [ppm]
- pressure500Height: 500 millibar pressure height [meters]
- windSpeed: wind speed [mph]
- humidity: relative humidity [%]
- tempSandburg: temperature at Sandberg, CA [degrees F]
- tempElMonte: temperature at El Monte, CA [degrees F]
- inversionBaseHeight: inversion base height [feet]
- pressureGradientDaggett: pressure gradient from LAX to Daggett, CA [mm Hg]
- inversionBaseTemp: inversion base temperature [degrees F]
- visibility: visibility [miles]

Source

Generic function for plotting a fractional polynomial curve estimate

Description

Plot a fractional polynomial curve estimate for either a single model or a Bayesian model average over BayesMfp objects. Optionally, credible intervals and / or bands can be added to the plot.

Usage

plotCurveEstimate(model, termName, plevel = 0.95, slevel = plevel, plot = TRUE, legendPos = "topleft", rug = FALSE, partialResids=TRUE, hpd=TRUE,..., main = NULL)

Arguments

- **model**: an object of class BayesMfp or BmaSamples
- **termName**: string denoting an FP term, as written by the summary method
- **plevel**: credible level for pointwise intervals, and NULL means no pointwise intervals (default: 0.95)
- **slevel**: credible level for simultaneous credible band (SCB), NULL means no SCB (defaults to plevel)
- **plot**: if FALSE, only return values needed to produce the plot, but do not plot (default is TRUE, so a plot is made)
- **legendPos**: position of coefficient estimates (for BayesMfp) or sample size (for BmaSamples) in the plot, NULL suppresses the printing (default is “topleft”)
- **rug**: add a rug to the plot? (default: FALSE)
- **partialResids**: add partial residuals to the plot? (default: TRUE)
- **hpd**: use HPD intervals (TRUE, default) or quantile-based (FALSE) intervals?
- **...**: further arguments in case of a BayesMfp object (see details) and arguments for plotting with matplot
- **main**: optional main argument for the plot

Details

Further arguments for application on a BayesMfp object:

- **grid**: vector of unscaled abscissae, default is a length gridSize grid over the observed range specified by providing the argument NULL.
- **post**: list with posterior parameters of the model, which may be provided manually to accelerate plotting in a loop
- **gridSize**: default number of grid points used when no grid is supplied (default is 201)
- **numSim**: number of simulations for estimation of the SCB (default is 500)
Value

a list of various plotting information:

- **original**: grid on the original covariate scale
- **grid**: grid on the transformed scale
- **mode**: mode curve values, only for `BayesMfp` object
- **mean**: pointwise mean curve values, only for `BmaSamples` object
- **median**: pointwise median curve values, only for `BmaSamples` object
- **plower**: lower boundaries for pointwise intervals
- **pupper**: upper boundaries for pointwise intervals
- **slower**: lower boundaries for SCB
- **supper**: upper boundaries for SCB
- **obsVals**: observed values of the covariate on the original scale
- **samplesize**: sample size underlying the curve estimate, only for `BmaSamples` object
- **partialResids**: partial residuals
- **transform**: vector of shift and scale parameter

See Also

`BayesMfp`, `BmaSamples`

Examples

```r
## construct a BayesMfp object
set.seed(19)
x1 <- rnorm (n=15)
x2 <- rbinom (n=15, size=20, prob=0.5)
x3 <- rexp (n=15)
y <- rt (n=15, df=2)

test <- BayesMfp (y ~ bfp (x2, max = 4) + uc (x1 + x3), nModels = 100, method="exhaustive")

## plot the x2 curve estimate for the 20-th best model
p1 <- plotCurveEstimate (test[20], "x2")

## look at the returned list
str(p1)

## plot the BMA curve estimate for the same covariate
ptestBma <- BmaSamples (test)
p2 <- plotCurveEstimate (ptestBma, "x2")

## look at the returned list
str(p2)

## try the new options:
plotCurveEstimate (ptestBma, "x2", partialResids=FALSE, hpd=FALSE)
```
posteriors

Extract posterior model probability estimates from BayesMfp objects

Description

Extract posterior model probability estimates (either normalized estimates or sampling frequencies) from BayesMfp objects.

Usage

posteriors(BayesMfpObject, ind = 1)

Arguments

- BayesMfpObject: a valid BayesMfp object, containing the models the probabilities of which one wants to estimate.
- ind: 
  - ind = 1 means normalized posteriors,
  - ind = 2 means sampling frequencies

Value

The vector of probability estimates.

Author(s)

Daniel Sabanés Bové

Examples

```r
## construct a BayesMfp object
set.seed(19)
x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
y <- rt(n=15, df=2)

test <- BayesMfp(y ~ bfp(x1, max = 2) + bfp(x2, max = 2) + uc(x3), nModels = 100, method="exhaustive")

## this works:
posteriors(test)

## this must not work:
## SoDA::muststop(posteriors(test, ind=2))

## only if we do model sampling there are model frequencies:
test2 <- BayesMfp(y ~ bfp(x1, max = 2) + bfp(x2, max = 2) + uc(x3), nModels = 100, method="sampling")
posteriors(test2, ind=2)
```
predict.BayesMfp

**predict.BayesMfp** *Predict method for BayesMfp objects*

**Description**

Predict new responses from a single multiple FP model.

**Usage**

```r
## S3 method for class 'BayesMfp' predict(object, newdata, ...)
```

**Arguments**

- `object` : valid `BayesMfp` object, from which only the first model will be used.
- `newdata` : new covariate data with exactly the names (and preferably ranges) as for the original `BayesMfp` call
- `...` : unused

**Author(s)**

Daniel Sabanés Bové

**See Also**

- `bmapredict`

**Examples**

```r
## generate a BayesMfp object
set.seed(19)
x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
y <- rt(n=15, df=2)
test <- BayesMfp(y ~ bfp(x2, max = 4) + uc(x1 + x3), nModels = 100, method="exhaustive")

## predict new responses at (again random) covariates
predict(test,
   newdata = list(x1 = rnorm(15),
                   x2 = rbinom(n=15, size=5, prob=0.2) + 1,
                   x3 = rexp(15)))
```
predict.BmaSamples

Predict method to extract point and interval predictions from BmaSamples objects

Description
Predict new responses from a Bayesian model average over FP models, from which predictive samples have already been produced.

Usage

## S3 method for class 'BmaSamples'
predict(object, level=0.95, hpd=TRUE, ...)
## S3 method for class 'predict.BmaSamples'
print(x, ...)

Arguments

- object: valid BmaSamples object
- level: credible level for the credible intervals (default: 95%)
- hpd: should empirical hpd intervals be used (default) or simple quantile-based?
- ...: unused
- x: object of S3 class predict.BmaSamples

Details
This function summarizes the predictive samples saved in the BmaSamples object. Using these functions, one can obtain predictive credible intervals, as opposed to just using the function bmapredict, which only gives the means of the predictive distributions.

Value
A list of class predict.BmaSamples, which has then a separate print method. The elements of the list are:

- intervalType: which credible intervals have been computed (either “HPD” or “equitailed”)
- level: the credible level
- newdata: the covariate data for the predicted data points (just copied from object)
- sampleSize: the sample size (just copied from object)
- nModels: the number of models (just copied from object)
- summaryMat: the summary matrix for the predictions, with median, mean, lower and upper credible interval borders.

Author(s)
Daniel Sabanes Bove
Simultaneous credible band computation (Besag algorithm)

Description
Simultaneous credible band computation

Usage
scrBesag(samples, level=0.95)

Arguments
samples   m by n matrix where m is the number of parameters, n is the number of samples and hence each (multivariate) sample is a column in the matrix samples
level    the credible level (default: 0.95)

Details
Calculates a series of simultaneous credible bounds for one parameter type.

Value
matrix with ‘lower’ and ‘upper’ rows

**scrHpd**

*Caculate an SCB from a samples matrix*

**Description**

Calculate an SCB from a samples matrix, which minimizes the absolute distances of the contained samples to a mode vector, at each gridpoint. Therefore the SCB might be considered an “HPD SCB”.

**Usage**

```
scrHpd(samples, mode = apply(samples, 2, median), level = 0.95)
```

**Arguments**

- **samples**: m by n matrix where m is the number of samples and n the number of parameters, hence each (multivariate) sample is a row in the matrix `samples`.
- **mode**: mode vector of length n (defaults to the vector of medians).
- **level**: credible level for the SCB (default: 0.95).

**Details**

This function first computes the matrix of absolute distances of the samples to the mode vector. Then based on this distance matrix, a one-sided SCB as described in Besag et al. (1995) is computed, which is then mapped back to the samples.

**Value**

A matrix with rows “lower” and “upper”, with the lower and upper SCB bounds.

empiricalHpd

Examples

## create some samples
time <- 1:10
nSamples <- 50
samples <- t(replicate(nSamples,
          time * rnorm(1) + rexp(1)) +
          rnorm(length(time) * nSamples))
matplot(time, t(samples), type="l", lty=1, col=1,
        xlab="time", ylab="response")

## now test the function: 50% credible band
scb <- scrHpd(samples, level=0.5)
matlines(time, t(scb), col=2, lwd=2, lty=1)

Summary of BayesMfp object

*Calculate and print the summary of a BayesMfp object*

Description

Calculate and print the summary of a BayesMfp object, using S3 methods for the class.

Usage

```r
## S3 method for class 'BayesMfp'
summary(object, level=0.95, table=TRUE,
         shrinkage=NULL, ...)
## S3 method for class 'summary.BayesMfp'
print(x, ...)
```

Arguments

- `object` a valid BayesMfp object
- `x` a return value of `summary.BayesMfp`
- `level` credible level for coefficients HPD intervals (default: 0.95)
- `table` should a data.frame of the models be included? (default)
- `shrinkage` shrinkage factor used, where NULL defaults to the posterior expected shrinkage factor
- `...` only used by `summary.BayesMfp` to pass arguments to `as.data.frame.BayesMfp`
Summary of BayesMfp object

Value

summary.BayesMfp returns a list with S3 class summary.BayesMfp, where the arguments “call”, “numVisited”, “termNames”, “shiftScaleMax”, “inclusionProbs”, “chainlength” (only for model sampling results) are copied from the attributes of the BayesMfp object, please see its help page for details.

The other elements are:

- dataframe the model overview as data.frame (only if table=TRUE was specified)
- localInclusionProbs local variable inclusion probability estimates
- nModels number of models contained in object

If there are multiple models in object, the list element postProbs contains the exact (for exhaustively explored model spaces) or estimated (if model sampling has been done) posterior model probabilities.

If object contains only one FP model, then this one is summarized in more detail:

- level used credible level for coefficients HPD intervals
- shrinkage used shrinkage factor
- summaryMat matrix with posterior summaries of the single coefficients: “mode” gives the posterior mode, “HPDlower” and “HPDupper” give the boundaries of the HPD intervals with specified credible level
- sigma2Sum posterior summary for the regression variance: again mode, and lower and upper HPD bounds are given in a rowvector.

Note

Note that if you extract the summary of a single model with these functions, you ignore the uncertainty about the shrinkage factor $t=g/(g+1)$ by plugging in the number shrinkage. If you want to incorporate this uncertainty, you must run BmaSamples on this model and call the corresponding method summary.BmaSamples.

summary.BmaSamples

Examples

```r
## generate a BayesMfp object
set.seed(19)

x1 <- rnorm(n=15)
x2 <- rbinom(n=15, size=20, prob=0.5)
x3 <- rexp(n=15)
```
Summary of BmaSamples object

Calculate and print the summary of a BmaSamples object

Description

Calculate and print the summary of a BmaSamples object, using S3 methods for the class.

Usage

## S3 method for class 'BmaSamples'
summary(object, level = 0.95, hpd = TRUE, ...)

## S3 method for class 'summary.BmaSamples'
print(x, table = TRUE, ...)

Arguments

- object: a valid BmaSamples object
- level: credible level for coefficients credible intervals
- hpd: should empirical hpd intervals be used (default) or simple quantile-based?
- x: a return value of summary.BmaSamples
- table: should the model table been shown? (default)
- ...: unused

Value

The summary method returns an S3 object, where “sampleSize”, “modelData” and “modelFreqs” are copied from the BmaSamples object, please see its help page for the details. “intervalType” and “level” copy the function’s parameters.

“summaryMat” contains the posterior summaries for the intercept and uncertain fixed form covariates. “sigma2Sum” and “shrinkageSum” contain the posterior summaries for the regression variance and the shrinkage factor, respectively. The summaries are always the median, mean, lower and upper credible bounds for the coefficients.
