**add_headers**

Add additional headers to a request.

**Description**

**Usage**

```r
add_headers(..., .headers = character())
```

**Arguments**

- `...` named header values. To stop an existing header from being set, pass an empty string: `""`.
- `.headers` a named character vector

**See Also**

`accept` and `content_type` for convenience functions for setting accept and content-type headers.

Other config: `authenticate`, `config`, `set_cookies`, `timeout`, `use_proxy`, `user_agent`, `verbose`

**Examples**

```r
add_headers(a = 1, b = 2)
add_headers(.headers = c(a = "1", b = "2"))
GET("http://httpbin.org/headers")

# Add arbitrary headers
GET("http://httpbin.org/headers",
    add_headers(version = version$version.string))

# Override default headers with empty strings
GET("http://httpbin.org/headers", add_headers(Accept = ""))
```

**authenticate**

Use http authentication.

**Description**

It’s not obvious how to turn authentication off after using it, so I recommend using custom handles with authentication.
BROWSE

Open specified url in browser.

Usage

BROWSE(url = NULL, config = list(), ..., handle = NULL)

Arguments

url
config
... handle

do the url of the page to retrieve
  All configuration options are ignored because the request is handled by the browser, not RCurl.
  Further named parameters, such as query, path, etc, passed on to modify_url. Unnamed parameters will be combined with config.
  The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default http requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.
cache_info

Details

Only works in interactive sessions.

See Also

Other http methods: DELETE, GET, HEAD, PATCH, POST, PUT, VERB

Examples

BROWSE("http://google.com")
BROWSE("http://had.co.nz")

cache_info

Compute caching information for a response.

Description

cache_info() gives details of cacheability of a response, rerequest() re-performs the original re-
quest doing as little work as possible (if not expired, returns response as is, or performs revalidation
if Etag or Last-Modified headers are present).

Usage

cache_info(r)

rerequest(r)

Arguments

r A response

Examples

# Never cached, always causes redownload
r1 <- GET("https://www.google.com")
cache_info(r1)
r1$date
rerequest(r1)$date

# Expires in a year
r2 <- GET("https://www.google.com/images/srpr/logolw.png")
cache_info(r2)
r2$date
rerequest(r2)$date

# Has last-modified and etag, so does revalidation
r3 <- GET("http://httpbin.org/cache")
cache_info(r3)
r3$date
Description

Generally you should only need to use this function to set CURL options directly if there isn’t already a helpful wrapper function, like `set_cookies, add_headers` or `authenticate`. To use this function effectively requires some knowledge of CURL, and CURL options. Use `httr_options` to see a complete list of available options. To see the libcurl documentation for a given option, use `curl_docs`.

Usage

`config(..., token = NULL)`

Arguments

`...` named Curl options.

token An OAuth token (1.0 or 2.0)

Details

Unlike Curl (and RCurl), all configuration options are per request, not per handle.

See Also

`set_config` to set global config defaults, and `with_config` to temporarily run code with set options.

All known available options are listed in `httr_options`

Other config: `add_headers, authenticate, set_cookies, timeout, use_proxy, user_agent, verbose`

Other ways to set configuration: `set_config, with_config`
Examples

```
# There are a number of ways to modify the configuration of a request
# * you can add directly to a request
HEAD("https://www.google.com", verbose())

# * you can wrap with with_config()
with_config(verbose(), HEAD("https://www.google.com"))

# * you can set global with set_config()
old <- set_config(verbose())
HEAD("https://www.google.com")
# and re-establish the previous settings with
set_config(old, override = TRUE)
HEAD("https://www.google.com")
# or
reset_config()
HEAD("https://www.google.com")

# If available, you should use a friendly httr wrapper over RCurl
# options. But you can pass Curl options (as listed in httr_options())
# in config
HEAD("https://www.google.com/", config(verbos = TRUE))
```

content

**Extract content from a request.**

Description

There are currently three ways to retrieve the contents of a request: as a raw object (`as = "raw"`), as a character vector, (`as = "text"`), and as parsed into an R object where possible, (`as = "parsed"`). If `as` is not specified, `content` does its best to guess which output is most appropriate.

Usage

```
content(x, as = NULL, type = NULL, encoding = NULL, ...)
```

Arguments

- **x** request object
- **as** desired type of output: raw, text or parsed. `content` attempts to automatically figure out which one is most appropriate, based on the content-type.
- **type** MIME type (aka internet media type) used to override the content type returned by the server. See [http://en.wikipedia.org/wiki/Internet_media_type](http://en.wikipedia.org/wiki/Internet_media_type) for a list of common types.
- **encoding** For text, overrides the charset or the Latin1 (ISO-8859-1) default, if you know that the server is returning the incorrect encoding as the charset in the content-type. Use for text and parsed outputs.
- **...** Other parameters parsed on to the parsing functions, if `as = "parsed"`
Details

content currently knows about the following mime types:

- text/html: `read_html`
- text/xml: `read_xml`
- text/csv: `read_csv`
- text/tab-separated-values: `read_tsv`
- application/json: `fromJSON`
- application/x-www-form-urlencoded: `parse_query`
- image/jpeg: `readJPEG`
- image/png: `readPNG`

as = "parsed" is provided as a convenience only: if the type you are trying to parse is not available, use as = "text" and parse yourself.

Value

For "raw", a raw vector.

For "text", a character vector of length 1. The character vector is always re-encoded to UTF-8. If this encoding fails (usually because the page declares an incorrect encoding), `content()` will return `NA`.

For "auto", a parsed R object.

WARNING

When using `content()` in a package, DO NOT use on as = "parsed". Instead, check the mime-type is what you expect, and then parse yourself. This is safer, as you will fail informatively if the API changes, and you will protect yourself against changes to httr.

See Also

Other response methods: `http_error`, `http_status`, `response`, `stop_for_status`

Examples

```r
r <- POST("http://httpbin.org/post", body = list(a = 1, b = 2))
content(r) # automatically parses JSON
cat(content(r, "text"), "\n") # text content
content(r, "raw") # raw bytes from server

rlogo <- content(GET("http://cran.r-project.org/Rlogo.jpg"))
plot(0:1, 0:1, type = "n")
rasterImage(rlogo, 0, 0, 1, 1)
```
**content_type**

| content_type | Set content-type and accept headers. |

**Description**

These are convenient wrappers around `add_headers`.

**Usage**

```python
content_type(type)

content_type_json()

content_type_xml()

accept(type)

accept_json()

accept_xml()
```

**Arguments**

- **type**
  - A mime type or a file extension. If a file extension (i.e. starts with .) will guess the mime type using `guess_type`.

**Details**

`accept_json/accept_xml` and `content_type_json/content_type_xml` are useful shortcuts to ask for json or xml responses or tell the server you are sending json/xml.

**Examples**

```python
GET("http://httpbin.org/headers")

GET("http://httpbin.org/headers", accept_json())
GET("http://httpbin.org/headers", accept("text/csv"))
GET("http://httpbin.org/headers", accept(".doc"))

GET("http://httpbin.org/headers", content_type_xml())
GET("http://httpbin.org/headers", content_type("text/csv"))
GET("http://httpbin.org/headers", content_type(".xml"))
```
cookies

Access cookies in a response.

Description
Access cookies in a response.

Usage
cookies(x)

Arguments
x A response.

See Also
set_cookies() to send cookies in request.

Examples
r <- GET("http://httpbin.org/cookies/set", query = list(a = 1, b = 2))
cookies(r)

DELETE

Send a DELETE request.

Description
Send a DELETE request.

Usage
DELETE(url = NULL, config = list(), ..., body = NULL,
encode = c("multipart", "form", "json", "raw"), handle = NULL)

Arguments
url the url of the page to retrieve
config Additional configuration settings such as http authentication (authenticate),
additional headers (add_headers), cookies (set_cookies) etc. See config for
full details and list of helpers.
... Further named parameters, such as query, path, etc, passed on to modify_url.
Unnamed parameters will be combined with config.
body One of the following:
DELETE

- FALSE: No body. This is typically not used with POST, PUT, or PATCH, but can be useful if you need to send a bodyless request (like GET) with VERB().
- NULL: An empty body
- "": A length 0 body
- upload_file("path/"): The contents of a file. The mime type will be guessed from the extension, or can be supplied explicitly as the second argument to upload_file()
- A character or raw vector: sent as is in body. Use content_type to tell the server what sort of data you are sending.
- A named list: See details for encode.

**encode**

If the body is a named list, how should it be encoded? Can be one of form (application/x-www-form-urlencoded), multipart, (multipart/form-data), or json (application/json).

For "multipart", list elements can be strings or objects created by upload_file.

For "form", elements are coerced to strings and escaped, use I() to prevent double-escaping. For "json", parameters are automatically "unboxed" (i.e. length 1 vectors are converted to scalars). To preserve a length 1 vector as a vector, wrap in I(). For "raw", either a character or raw vector. You'll need to make sure to set the content_type() yourself.

**handle**

The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default httr requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.

**RFC2616**

The DELETE method requests that the origin server delete the resource identified by the Request-URI. This method MAY be overridden by human intervention (or other means) on the origin server. The client cannot be guaranteed that the operation has been carried out, even if the status code returned from the origin server indicates that the action has been completed successfully. However, the server SHOULD NOT indicate success unless, at the time the response is given, it intends to delete the resource or move it to an inaccessible location.

A successful response SHOULD be 200 (OK) if the response includes an entity describing the status, 202 (Accepted) if the action has not yet been enacted, or 204 (No Content) if the action has been enacted but the response does not include an entity.

If the request passes through a cache and the Request-URI identifies one or more currently cached entities, those entries SHOULD be treated as stale. Responses to this method are not cacheable.

**See Also**

Other http methods: BROWSE, GET, HEAD, PATCH, POST, PUT, VERB

**Examples**

DELETE("http://httpbin.org/delete")
POST("http://httpbin.org/delete")
GET

**GET a url.**

**Description**
GET a url.

**Usage**
```
GET(url = NULL, config = list(), ..., handle = NULL)
```

**Arguments**
- `url` the url of the page to retrieve
- `config` Additional configuration settings such as http authentication (authenticate), additional headers (add_headers), cookies (set_cookies) etc. See `config` for full details and list of helpers.
- `...` Further named parameters, such as query, path, etc, passed on to `modify_url`. Unnamed parameters will be combined with `config`.
- `handle` The handle to use with this request. If not supplied, will be retrieved and reused from the `handle_pool` based on the scheme, hostname and port of the url. By default `httr` requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See `handle_pool` for more details.

**RFC2616**
The GET method means retrieve whatever information (in the form of an entity) is identified by the Request-URI. If the Request-URI refers to a data-producing process, it is the produced data which shall be returned as the entity in the response and not the source text of the process, unless that text happens to be the output of the process.

The semantics of the GET method change to a "conditional GET" if the request message includes an If-Modified-Since, If-Unmodified-Since, If-Match, If-None-Match, or If-Range header field. A conditional GET method requests that the entity be transferred only under the circumstances described by the conditional header field(s). The conditional GET method is intended to reduce unnecessary network usage by allowing cached entities to be refreshed without requiring multiple requests or transferring data already held by the client.

The semantics of the GET method change to a "partial GET" if the request message includes a Range header field. A partial GET requests that only part of the entity be transferred, as described in [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35) The partial GET method is intended to reduce unnecessary network usage by allowing partially-retrieved entities to be completed without transferring data already held by the client.

**See Also**
Other http methods: **BROWSE, DELETE, HEAD, PATCH, POST, PUT, VERB**
get_callback

Examples

GET("http://google.com")
GET("http://google.com", path = "search")
GET("http://google.com", path = "search", query = list(q = "ham"))

# See what GET is doing with httpbin.org
url <- "http://httpbin.org/get"
GET(url)
GET(url, add_headers(a = 1, b = 2))
GET(url, set_cookies(a = 1, b = 2))
GET(url, add_headers(a = 1, b = 2), set_cookies(a = 1, b = 2))
GET(url, authenticate("username", "password"))
GET(url, verbose())

# You might want to manually specify the handle so you can have multiple
# independent logins to the same website.
google <- handle("http://google.com")
GET(handle = google, path = "/")
GET(handle = google, path = "search")

get_callback

Install or uninstall a callback function

Description

Supported callback functions:

‘request’ This callback is called before an HTTP request is performed, with the request object as an argument. If the callback returns a value other than NULL, the HTTP request is not performed at all, and the return value of the callback is returned. This mechanism can be used to replay previously recorded HTTP responses.

‘response’ This callback is called after an HTTP request is performed. The callback is called with two arguments: the request object and the response object of the HTTP request. If this callback returns a value other than NULL, then this value is returned by httr.

Usage

get_callback(name)

set_callback(name, new_callback = NULL)

Arguments

name Character scalar, name of the callback to query or set.
new_callback The callback function to install, a function object; or NULL to remove the currently installed callback (if any).
get_callback

Details

Note that it is not possible to install multiple callbacks of the same type. The installed callback overwrites the previously installed one. To uninstall a callback function, set it to NULL with set_callback().

See the httpmock package for a proper example that uses callbacks.

Value

get_callback returns the currently installed callback, or NULL if none is installed.

set_callback returns the previously installed callback, or NULL if none was installed.

Examples

```r
## Not run:
## Log all HTTP requests to the screeen
req_logger <- function(req) {
  cat("HTTP request to", sQuote(req$url), "\n")
}
old <- set_callback("request", req_logger)
g1 <- GET("https://httpbin.org")
g2 <- GET("https://httpbin.org/ip")
set_callback("request", old)

## Log all HTTP requests and response status codes as well
req_logger2 <- function(req) {
  cat("HTTP request to", sQuote(req$url), " ... ")
}
res_logger <- function(req, res) {
  cat(res$status_code, "\n")
}
old_req <- set_callback("request", req_logger2)
old_res <- set_callback("response", res_logger)
g3 <- GET("https://httpbin.org")
g4 <- GET("https://httpbin.org/ip")
set_callback("request", old_req)
set_callback("response", old_res)

## Return a recorded response, without performing the HTTP request
replay <- function(req) {
  if (req$url == "https://httpbin.org") g3
}
old_req <- set_callback("request", replay)
grec <- GET("https://httpbin.org")
grec$date == g3$date
set_callback("request", old_req)

## End(Not run)
```
Create a handle tied to a particular host.

Description

This handle preserves settings and cookies across multiple requests. It is the foundation of all requests performed through the httr package, although it will mostly be hidden from the user.

Usage

```r
handle(url, cookies = TRUE)
```

Arguments

- `url`: full url to site
- `cookies`: DEPRECATED

Note

Because of the way argument dispatch works in R, using `handle()` in the http methods (See `GET`) will cause problems when trying to pass configuration arguments (See examples below). Directly specifying the handle when using http methods is not recommended in general, since the selection of the correct handle is taken care of when the user passes an url (See `handle_pool`).

Examples

```r
handle("http://google.com")
handle("https://google.com")

h <- handle("http://google.com")
GET(handle = h)
# Should see cookies sent back to server
GET(handle = h, config = verbose())

h <- handle("http://google.com", cookies = FALSE)
GET(handle = h)$cookies

## Not run:
# Using the preferred way of configuring the http methods
# will not work when using handle():
GET(handle = h, timeout(10))
# Passing named arguments will work properly:
GET(handle = h, config = list(timeout(10), add_headers(Accept = "")))

## End(Not run)
```
**HEAD**

*Get url HEADers.*

**Description**

Get url HEADers.

**Usage**

`HEAD(url = NULL, config = list(), ..., handle = NULL)`

**Arguments**

- **url**
  - the url of the page to retrieve
- **config**
  - Additional configuration settings such as http authentication (authenticate), additional headers (add_headers), cookies (set_cookies) etc. See config for full details and list of helpers.
- **...**
  - Further named parameters, such as query, path, etc, passed on to modify_url. Unnamed parameters will be combined with config.
- **handle**
  - The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default http requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.

**RFC2616**

The HEAD method is identical to GET except that the server MUST NOT return a message-body in the response. The metainformation contained in the HTTP headers in response to a HEAD request SHOULD be identical to the information sent in response to a GET request. This method can be used for obtaining metainformation about the entity implied by the request without transferring the entity-body itself. This method is often used for testing hypertext links for validity, accessibility, and recent modification.

The response to a HEAD request MAY be cacheable in the sense that the information contained in the response MAY be used to update a previously cached entity from that resource. If the new field values indicate that the cached entity differs from the current entity (as would be indicated by a change in Content-Length, Content-MD5, ETag or Last-Modified), then the cache MUST treat the cache entry as stale.

**See Also**

Other http methods: BROWSE, DELETE, GET, PATCH, POST, PUT, VERB

**Examples**

`HEAD("http://google.com")`
`headers(HEAD("http://google.com"))`
headers

Extract the headers from a response

Description

Extract the headers from a response

Usage

headers(x)

Arguments

x A request object

See Also

add_headers() to send additional headers in a request

Examples

r <- GET("http://httpbin.org/get")
headers(r)

http_error

Check for an http error.

Description

Check for an http error.

Usage

http_error(x, ...)

Arguments

x Object to check. Default methods are provided for strings (which perform an HEAD request), responses, and integer status codes.

... Other arguments passed on to methods.

Value

TRUE if the request fails (status code 400 or above), otherwise FALSE.
See Also

Other response methods: content, http_status, response, stop_for_status

Examples

# You can pass a url:
http_error("http://www.google.com")
http_error("http://httpbin.org/status/404")

# Or a request
r <- GET("http://httpbin.org/status/201")
http_error(r)

# Or an (integer) status code
http_error(200L)
http_error(404L)

http_status Give information on the status of a request.

Description

Extract the http status code and convert it into a human readable message.

Usage

http_status(x)

Arguments

x a request object or a number.

Details

http servers send a status code with the response to each request. This code gives information regarding the outcome of the execution of the request on the server. Roughly speaking, codes in the 100s and 200s mean the request was successfully executed; codes in the 300s mean the page was redirected; codes in the 400s mean there was a mistake in the way the client sent the request; codes in the 500s mean the server failed to fulfill an apparently valid request. More details on the codes can be found at http://en.wikipedia.org/wiki/Http_error_codes.

Value

If the status code does not match a known status, an error. Otherwise, a list with components
category the broad category of the status
message the meaning of the status code
See Also

Other response methods: `content`, `http_error`, `response`, `stop_for_status`

Examples

```r
http_status(100)
http_status(404)

x <- GET("http://httpbin.org/status/200")
http_status(x)

http_status(GET("http://httpbin.org/status/300"))
http_status(GET("http://httpbin.org/status/301"))
http_status(GET("http://httpbin.org/status/404"))

# errors out on unknown status
## Not run: http_status(GET("http://httpbin.org/status/320"))
```

## http_type

### Extract the content type of a response

**Description**

Extract the content type of a response

**Usage**

```r
http_type(x)
```

**Arguments**

- `x` A response

**Value**

A string giving the complete mime type, with all parameters stripped off.

**Examples**

```r
r1 <- GET("http://httpbin.org/image/png")
http_type(r1)
headers(r1)[["Content-Type"]]

r2 <- GET("http://httpbin.org/ip")
http_type(r2)
headers(r2)[["Content-Type"]]
```
httr_dr

**Diagnose common configuration problems**

**Description**
Currently one check: that curl uses nss.

**Usage**
httr_dr()

httr_options

**List available options.**

**Description**
This function lists all available options for `config()`. It provides both the short R name which you use with httr, and the longer Curl name, which is useful when searching the documentation. curl_doc opens a link to the libcurl documentation for an option in your browser.

**Usage**
httr_options(matches)
curl_doc(x)

**Arguments**

<table>
<thead>
<tr>
<th>matches</th>
<th>If not missing, this restricts the output so that either the httr or curl option matches this regular expression.</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>An option name (either short or full).</td>
</tr>
</tbody>
</table>

**Details**
RCurl and httr use slightly different names to libcurl: the initial CURLOPT_ is removed, all underscores are converted to periods and the option is given in lower case. Thus "CURLOPT_SSLENGINE_DEFAULT" becomes "sslengine.default".

**Value**
A data frame with three columns:

<table>
<thead>
<tr>
<th>httr</th>
<th>The short name used in httr</th>
</tr>
</thead>
<tbody>
<tr>
<td>libcurl</td>
<td>The full name used by libcurl</td>
</tr>
<tr>
<td>type</td>
<td>The type of R object that the option accepts</td>
</tr>
</tbody>
</table>
modify_url

Examples

```r
httr_options()
httr_options("post")
```

# Use curl_docs to read the curl documentation for each option.
# You can use either the httr or curl option name.
curl_docs("userpwd")
curl_docs("CURLOPT_USERPWD")

---

**modify_url**  
Modify a url.

---

**Description**

Modify a url by first parsing it and then replacing components with the non-NULL arguments of this function.

**Usage**

```r
modify_url(url, scheme = NULL, hostname = NULL, port = NULL, path = NULL, query = NULL, params = NULL, fragment = NULL, username = NULL, password = NULL)
```

**Arguments**

- `url`  
  the url to modify

- `scheme, hostname, port, path, query, params, fragment, username, password`
  components of the url to change

---

**oauth1.0_token**  
Generate an oauth1.0 token.

---

**Description**

This is the final object in the OAuth dance - it encapsulates the app, the endpoint, other parameters and the received credentials.

**Usage**

```r
oauth1.0_token(endpoint, app, permission = NULL, as_header = TRUE, private_key = NULL, cache = getOption("httr_oauth_cache"))
```
oauth2.0_token

Arguments

endpoint   An OAuth endpoint, created by `oauth_endpoint`
app        An OAuth consumer application, created by `oauth_app`
permission optional, a string of permissions to ask for.
as_header  If TRUE, the default, sends oauth in header. If FALSE, adds as parameter to url.
private_key Optional, a key provided by `read_key`. Used for signed OAuth 1.0.
cache      A logical value or a string. TRUE means to cache using the default cache file `.http~oauth`, FALSE means don’t cache, and NA means to guess using some sensible heuristics. A string mean use the specified path as the cache file.

Details

See `Token` for full details about the token object, and the caching policies used to store credentials across sessions.

Value

A Token1.0 reference class (RC) object.

See Also

Other OAuth: `oauth2.0_token, oauth_app, oauth_endpoint, oauth_service_token`

---

oauth2.0_token

Generate an oauth2.0 token.

Description

This is the final object in the OAuth dance - it encapsulates the app, the endpoint, other parameters and the received credentials. It is a reference class so that it can be seamlessly updated (e.g. using `$refresh()`) when access expires.

Usage

```r
oauth2.0_token(endpoint, app, scope = NULL, user_params = NULL,
type = NULL, use_oob = getOption("http_oob_default"), as_header = TRUE,
use_basic_auth = FALSE, cache = getOption("http_oauth_cache"),
config_init = list(), client_credentials = FALSE, credentials = NULL)
```
Arguments

- **endpoint**: An OAuth endpoint, created by `oauth_endpoint`.
- **app**: An OAuth consumer application, created by `oauth_app`.
- **scope**: A character vector of scopes to request.
- **user_params**: Named list holding endpoint specific parameters to pass to the server when posting the request for obtaining or refreshing the access token.
- **type**: Content type used to override incorrect server response.
- **use_oob**: If FALSE, use a local webserver for the OAuth dance. Otherwise, provide a URL to the user and prompt for a validation code. Defaults to the of the "http_oob_default" default, or TRUE if httpuv is not installed.
- **as_header**: If TRUE, the default, configures the token to add itself to the bearer header of subsequent requests. If FALSE, configures the token to add itself as a url parameter of subsequent requests.
- **use_basic_auth**: If TRUE use http basic authentication to retrieve the token. Some authorization servers require this. If FALSE, the default, retrieve the token by including the app key and secret in the request body.
- **cache**: A logical value or a string. TRUE means to cache using the default cache file `.httpoauth`, FALSE means don’t cache, and NA means to guess using some sensible heuristics. A string mean use the specified path as the cache file.
- **config_init**: Additional configuration settings sent to POST, e.g. `user_agent`.
- **credentials**: Advanced use only: allows you to completely customise token generation.

Details

See [Token](#) for full details about the token object, and the caching policies used to store credentials across sessions.

Value

A Token2.0 reference class (RC) object.

See Also

Other OAuth: `oauth1.0_token, oauth_app, oauth_endpoint, oauth_service_token`
oauth_app

Create an OAuth application.

Description

The OAuth framework doesn’t match perfectly to use from R. Each user of the package for a particular OAuth enabled site must create their own application. See the demos for instructions on how to do this for linkedin, twitter, vimeo, facebook, github and google.

Usage

oauth_app(appname, key, secret = NULL, redirect_uri = oauth_callback())

Arguments

appname  name of the application. This is not used for OAuth, but is used to make it easier to identify different applications and provide a consistent way of storing secrets in environment variables.
key  consumer key (equivalent to a user name)
secret  consumer secret. This is not equivalent to a password, and is not really a secret. If you are writing an API wrapper package, it is fine to include this secret in your package code. Use NULL to not store a secret: this is useful if you’re relying on cached OAuth tokens.
redirect_uri  The URL that user will be redirected to after authorisation is complete. You should generally leave this as the default unless you’re using a non-standard auth flow (like with shiny).

See Also

Other OAuth: oauth1.0_token, oauth2.0_token, oauth_endpoint, oauth_service_token

Examples

```r
# Not run:
# These work on my computer because I have the right envvars set up
linkedin_app <- oauth_app("linkedin", key = "oumakw3859gy")
github_app <- oauth_app("github", "56b637a5baaffac62cad9")

# End(Not run)

# If you're relying on caching, supply an explicit NULL to
# suppress the warning message
oauth_app("my_app", "mykey")
oauth_app("my_app", "mykey", NULL)
```
oauth_endpoint

Description

Describe an OAuth endpoint.

Usage

oauth_endpoint(request = NULL, authorize, access, ..., base_url = NULL)

Arguments

request url used to request initial (unauthenticated) token. If using OAuth2.0, leave as NULL.
authorize url to send client to for authorisation. Set to NULL if not needed
access url used to exchange unauthenticated for authenticated token.
... other additional endpoints.
base_url option url to use as base for request, authorize and access urls.

See Also

Other OAuth: oauth1.0_token, oauth2.0_token, oauth_app, oauth_service_token

Examples

linkedin <- oauth_endpoint("requestToken", "authorize", "accessToken",
    base_url = "https://api.linkedin.com/uas/oauth")
github <- oauth_endpoint(NULL, "authorize", "access_token",
    base_url = "https://github.com/login/oauth")
facebook <- oauth_endpoint(
    authorize = "https://www.facebook.com/dialog/oauth",
    access = "https://graph.facebook.com/oauth/access_token")
oauth_endpoints

oauth_endpoints

Description

Provides some common OAuth endpoints.

Usage

oauth_endpoints(name)
Arguments

name One of the following endpoints: linkedin, twitter, vimeo, google, facebook, github, azure.

Examples

oauth_endpoints("twitter")

oauth_service_token Generate OAuth token for service accounts.

Description

Service accounts provide a way of using OAuth2 without user intervention. They instead assume that the server has access to a private key used to sign requests. The OAuth app is not needed for service accounts: that information is embedded in the account itself.

Usage

oauth_service_token(endpoint, secrets, scope = NULL, sub = NULL)

Arguments

department An OAuth endpoint, created by oauth_endpoint
secrets Secrets loaded from JSON file, downloaded from console.
scope a character vector of scopes to request.
sub The email address of the user for which the application is requesting delegated access.

See Also

Other OAuth: oauth1.0_token, oauth2.0_token, oauth_app, oauth_endpoint

Examples

## Not run:
endpoint <- oauth_endpoints("google")
secrets <- jsonlite::fromJSON("~/Desktop/httrtest-45693cbfac92.json")
scope <- "https://www.googleapis.com/auth/bigquery.readonly"

token <- oauth_service_token(endpoint, secrets, scope)

## End(Not run)
parse_http_date

Parse and print http dates.

Description

As defined in RFC2616, [http://www.w3.org/Protocols/rfc2616/rfc2616.html#sec3.3](http://www.w3.org/Protocols/rfc2616/rfc2616.html#sec3.3), there are three valid formats:

- Sun, 06 Nov 1994 08:49:37 GMT ; RFC 822, updated by RFC 1123
- Sunday, 06-Nov-94 08:49:37 GMT ; RFC 850, obsoleted by RFC 1036
- Sun Nov 6 08:49:37 1994 ; ANSI C’s asctime() format

Usage

parse_http_date(x, failure = NA)

http_date(x)

Arguments

x For parse_http_date, a character vector of strings to parse. All elements must be of the same type.
   For http_date, a POSIXt vector.

failure What to return on failure?

Value

A POSIXct object if successful, otherwise failure

Examples

parse_http_date("Sun, 06 Nov 1994 08:49:37 GMT")
parse_http_date("Sunday, 06-Nov-94 08:49:37 GMT")
parse_http_date("Sun Nov 6 08:49:37 1994")

http_date(Sys.time())
parse_url  

Parse and build urls according to RFC1808.

Description

Usage

parse_url(url)

build_url(url)

Arguments

url  

For parse_url a character vector (of length 1) to parse into components; for build_url a list of components to turn back into a string.

Value

a list containing:

- scheme
- hostname
- port
- path
- params
- fragment
- query, a list
- username
- password

Examples

```r
code
parse_url("http://google.com/")
parsed_url("http://google.com:80/")
parsed_url("http://google.com:80/?a=1&b=2")
url <- parse_url("http://google.com/")
scheme <- "https"
query <- list(q = "hello")
build_url(url)
```
PATCH

Send PATCH request to a server.

Description

Send PATCH request to a server.

Usage

```
PATCH(url = NULL, config = list(), ..., body = NULL,
      encode = c("multipart", "form", "json", "raw"), handle = NULL)
```

Arguments

- **url**
  - the url of the page to retrieve
- **config**
  - Additional configuration settings such as http authentication (authenticate), additional headers (add_headers), cookies (set_cookies) etc. See config for full details and list of helpers.
- **...**
  - Further named parameters, such as query, path, etc, passed on to modify_url. Unnamed parameters will be combined with config.
- **body**
  - One of the following:
    - `FALSE`: No body. This is typically not used with POST, PUT, or PATCH, but can be useful if you need to send a bodyless request (like GET) with `VERB()`.  
    - `NULL`: An empty body
    - `"": A length 0 body
    - `upload_file("path/")`: The contents of a file. The mime type will be guessed from the extension, or can be supplied explicitly as the second argument to upload_file()
    - A character or raw vector: sent as is in body. Use `content_type` to tell the server what sort of data you are sending.
    - A named list: See details for encode.
- **encode**
  - If the body is a named list, how should it be encoded? Can be one of form (application/x-www-form-urlencoded), multipart, (multipart/form-data), or json (application/json).
  - For "multipart", list elements can be strings or objects created by upload_file.
  - For "form", elements are coerced to strings and escaped, use I() to prevent double-escaping. For "json", parameters are automatically "unboxed" (i.e. length 1 vectors are converted to scalars). To preserve a length 1 vector as a vector, wrap in I(). For "raw", either a character or raw vector. You’ll need to make sure to set the `content_type()` yourself.
- **handle**
  - The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default httr requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.
See Also

Other http methods: BROWSE, DELETE, GET, HEAD, POST, PUT, VERB

POST

POST file to a server.

Description

POST file to a server.

Usage

POST(url = NULL, config = list(), ..., body = NULL,
     encode = c("multipart", "form", "json", "raw"), handle = NULL)

Arguments

url

the url of the page to retrieve

config

Additional configuration settings such as http authentication (authenticate),
additional headers (add_headers), cookies (set_cookies) etc. See config for
full details and list of helpers.

... Further named parameters, such as query, path, etc, passed on to modify_url.
Unnamed parameters will be combined with config.

body

One of the following:

• FALSE: No body. This is typically not used with POST, PUT, or PATCH, but
  can be useful if you need to send a bodyless request (like GET) with VERB().
• NULL: An empty body
• "": A length 0 body
• upload_file("path/"): The contents of a file. The mime type will be
guessed from the extension, or can be supplied explicitly as the second
argument to upload_file()
• A character or raw vector: sent as is in body. Use content_type to tell the
  server what sort of data you are sending.
• A named list: See details for encode.

encode

If the body is a named list, how should it be encoded? Can be one of form
(application/x-www-form-urlencoded), multipart, (multipart/form-data), or json
(application/json).

For "multipart", list elements can be strings or objects created by upload_file.
For "form", elements are coerced to strings and escaped, use I() to prevent
double-escaping. For "json", parameters are automatically "unboxed" (i.e. length
1 vectors are converted to scalars). To preserve a length 1 vector as a vector,
wrap in I(). For "raw", either a character or raw vector. You’ll need to make
sure to set the content_type() yourself.
The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default http requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.

See Also

Other http methods: BROWSE, DELETE, GET, HEAD, PATCH, PUT, VERB

Examples

b2 <- "http://httpbin.org/post"
POST(b2, body = "A simple text string")
POST(b2, body = list(x = "A simple text string"))
POST(b2, body = list(y = upload_file(system.file("CITATION"))))
POST(b2, body = list(x = "A simple text string"), encode = "json")

# Various types of empty body:
POST(b2, body = NULL, verbose())
POST(b2, body = FALSE, verbose())
POST(b2, body = "", verbose())

cap_speed <- config(max_recv_speed_large = 10000)

# If file size is known, you get a progress bar:
x <- GET("http://httpbin.org/bytes/102400", progress(), cap_speed)
# Otherwise you get the number of bytes downloaded:
x <- GET("http://httpbin.org/stream-bytes/102400", progress(), cap_speed)
**PUT**

Send PUT request to server.

**Description**

Send PUT request to server.

**Usage**

```r
PUT(url = NULL, config = list(), ..., body = NULL, 
    encode = c("multipart", "form", "json", "raw"), handle = NULL)
```

**Arguments**

- `url` the url of the page to retrieve
- `config` Additional configuration settings such as http authentication (`authenticate`), additional headers (`add_headers`), cookies (`set_cookies`) etc. See `config` for full details and list of helpers.
- `...` Further named parameters, such as query, path, etc, passed on to `modify_url`. Unnamed parameters will be combined with `config`.
- `body` One of the following:
  - `FALSE`: No body. This is typically not used with `POST`, `PUT`, or `PATCH`, but can be useful if you need to send a bodyless request (like `GET`) with `VERB()`.
  - `NULL`: An empty body
  - `"": A length 0 body
  - `upload_file("path/")`: The contents of a file. The mime type will be guessed from the extension, or can be supplied explicitly as the second argument to `upload_file()`
  - A character or raw vector: sent as is in body. Use `content_type` to tell the server what sort of data you are sending.
  - A named list: See details for `encode`.
- `encode` If the body is a named list, how should it be encoded? Can be one of form (`application/x-www-form-urlencoded`), `multipart`, (`multipart/form-data`), or `json` (`application/json`).
  For "multipart", list elements can be strings or objects created by `upload_file`. For "form", elements are coerced to strings and escaped, use `I()` to prevent double-escaping. For "json", parameters are automatically "unboxed" (i.e. length 1 vectors are converted to scalars). To preserve a length 1 vector as a vector, wrap in `I()`. For "raw", either a character or raw vector. You’ll need to make sure to set the `content_type()` yourself.
- `handle` The handle to use with this request. If not supplied, will be retrieved and reused from the `handle_pool` based on the scheme, hostname and port of the url. By default `httr` requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See `handle_pool` for more details.
**response**

**See Also**

Other http methods: BROWSE, DELETE, GET, HEAD, PATCH, POST, VERB

**Examples**

```
POST("http://httpbin.org/put")
PUT("http://httpbin.org/put")

b2 <- "http://httpbin.org/put"
PUT(b2, body = "A simple text string")
PUT(b2, body = list(x = "A simple text string"))
PUT(b2, body = list(y = upload_file(system.file("CITATION"))))
PUT(b2, body = list(x = "A simple text string"), encode = "json")
```

---

**response**

The response object.

**Description**

The response object captures all information from a request. It includes fields:

**Details**

- **url** the url the request was actually sent to (after redirects)
- **handle** the handle associated with the url
- **status_code** the http status code
- **header** a named list of headers returned by the server
- **cookies** a named list of cookies returned by the server
- **content** the body of the response, as raw vector. See content for various ways to access the content.
- **time** request timing information
- **config** configuration for the request

**See Also**

Other response methods: content, http_error, http_status, stop_for_status
RETRY  

Retry a request until it succeeds.

Description

Safely retry a request until it succeeds, as defined by the terminate_on parameter, which by default means a response for which http_error() is FALSE. Will also retry on error conditions raised by the underlying curl code, but if the last retry still raises one, RETRY will raise it again with stop(). It is designed to be kind to the server: after each failure randomly waits up to twice as long. (Technically it uses exponential backoff with jitter, using the approach outlined in https://www.awsarchitectureblog.com/2015/03/backoff.html.) If the server returns status code 429 and specifies a retry-after value, that value will be used instead, unless it’s smaller than pause_min.

Usage

RETRY(verb, url = NULL, config = list(), ..., body = NULL, encode = c("multipart", "form", "json", "raw"), times = 3, pause_base = 1, pause_cap = 60, pause_min = 1, handle = NULL, quiet = FALSE, terminate_on = NULL)

Arguments

verb  
Name of verb to use.

url  
the url of the page to retrieve

config  
Additional configuration settings such as http authentication (authenticate), additional headers (add_headers), cookies (set_cookies) etc. See config for full details and list of helpers.

...  
Further named parameters, such as query, path, etc, passed on to modify_url. Unnamed parameters will be combined with config.

body  
One of the following:

- FALSE: No body. This is typically not used with POST, PUT, or PATCH, but can be useful if you need to send a bodyless request (like GET) with VERB().
- NULL: An empty body
- "": A length 0 body
- upload_file("path/"): The contents of a file. The mime type will be guessed from the extension, or can be supplied explicitly as the second argument to upload_file()
- A character or raw vector: sent as is in body. Use content_type to tell the server what sort of data you are sending.
- A named list: See details for encode.

encode  
If the body is a named list, how should it be encoded? Can be one of form (application/x-www-form-urlencoded), multipart, (multipart/form-data), or json (application/json).
For "multipart", list elements can be strings or objects created by `upload_file`. For "form", elements are coerced to strings and escaped, use `I()` to prevent double-escaping. For "json", parameters are automatically "unboxed" (i.e. length 1 vectors are converted to scalars). To preserve a length 1 vector as a vector, wrap in `I()`. For "raw", either a character or raw vector. You'll need to make sure to set the `content_type()` yourself.

**times**

Maximum number of requests to attempt.

**pause_base, pause_cap**

This method uses exponential back-off with full jitter - this means that each request will randomly wait between 0 and `pause_base * 2 ^ attempt` seconds, up to a maximum of `pause_cap` seconds.

**pause_min**

Minimum time to wait in the backoff; generally only necessary if you need pauses less than one second (which may not be kind to the server, use with caution!).

**handle**

The handle to use with this request. If not supplied, will be retrieved and reused from the `handle_pool` based on the scheme, hostname and port of the url. By default `httr` requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See `handle_pool` for more details.

**quiet**

If `false`, will print a message displaying how long until the next request.

**terminate_on**

Optional vector of numeric HTTP status codes that if found on the response will terminate the retry process. If `null`, will keep retrying while `http_error()` is `TRUE` for the response.

**Value**

The last response. Note that if the request doesn’t succeed after `times` times this will be a failed request, i.e. you still need to use `stop_for_status()`.

**Examples**

```r
# Succeeds straight away
RETRY("GET", "http://httpbin.org/status/200")

# Never succeeds
RETRY("GET", "http://httpbin.org/status/500")

# Invalid hostname generates curl error condition and is retried but eventually
# raises an error condition.
RETRY("GET", "http://invalidhostname/")
```

---

**revoke_all**

Revoke all OAuth tokens in the cache.
Description
Use this function if you think that your token may have been compromised, e.g. you accidentally
uploaded the cache file to github. It’s not possible to automatically revoke all tokens - this function
will warn when it can’t.

Usage
revoke_all(cache_path = NA)

Arguments
cache_path  Path to cache file. Defaults to ‘.httr-oauth’ in current directory.

---

Description
Set (and reset) global httr configuration.

Usage
set_config(config, override = FALSE)
reset_config()

Arguments
cconfig     Settings as generated by add_headers, set_cookies or authenticate.
override    if TRUE, ignore existing settings, if FALSE, combine new config with old.

Value
invisibility, the old global config.

See Also
Other ways to set configuration: config, with_config

Examples
GET("http://google.com")
set_config(verbose())
GET("http://google.com")
reset_config()
GET("http://google.com")
**set_cookies**

Set cookies.

**Usage**

```r
set_cookies(..., .cookies = character(0))
```

**Arguments**

- `...`: a named cookie values
- `cookies`: a named character vector

**See Also**

`cookies()` to see cookies in response.

Other config: `add_headers`, `authenticate`, `config`, `timeout`, `use_proxy`, `user_agent`, `verbose`

**Examples**

```r
set_cookies(a = 1, b = 2)
set_cookies(.cookies = c(a = "1", b = "2"))
GET("http://httpbin.org/cookies")
GET("http://httpbin.org/cookies", set_cookies(a = 1, b = 2))
```

---

**status_code**

Extract status code from response.

**Description**

Extract status code from response.

**Usage**

```r
status_code(x)
```

**Arguments**

- `x`: A response
stop_for_status  

Description

Converts http errors to R errors or warnings - these should always be used whenever you’re creating requests inside a function, so that the user knows why a request has failed.

Usage

```r
stop_for_status(x, task = NULL)
warn_for_status(x, task = NULL)
message_for_status(x, task = NULL)
```

Arguments

- `x`: a response, or numeric http code (or other object with status_code method)
- `task`: The text of the message: either NULL or a character vector. If non-NULL, the error message will finish with "Failed to task".

Value

If request was successful, the response (invisibly). Otherwise, raised a classed http error or warning, as generated by `http_condition`

See Also

Other response methods: `content`, `http_error`, `http_status`, `response`

Examples

```r
x <- GET("http://httpbin.org/status/200")
stop_for_status(x) # nothing happens
warn_for_status(x)
message_for_status(x)

x <- GET("http://httpbin.org/status/300")
## Not run: stop_for_status(x)
warn_for_status(x)
message_for_status(x)

x <- GET("http://httpbin.org/status/404")
## Not run: stop_for_status(x)
warn_for_status(x)
```
timeout

Set maximum request time.

Description
Set maximum request time.

Usage
timeout(seconds)

Arguments
seconds number of seconds to wait for a response until giving up. Can not be less than 1 ms.

See Also
Other config: add_headers, authenticate, config, set_cookies, use_proxy, user_agent, verbose

Examples
## Not run:
GET("http://httpbin.org/delay/3", timeout(1))
GET("http://httpbin.org/delay/1", timeout(2))

## End(Not run)

upload_file Upload a file with POST or PUT.

Description
Upload a file with POST or PUT.

Usage
upload_file(path, type = NULL)
Arguments
  path     path to file
  type     mime type of path. If not supplied, will be guess by guess_type when needed.

Examples
  citation <- upload_file(system.file("CITATION"))
  POST("http://httpbin.org/post", body = citation)
  POST("http://httpbin.org/post", body = list(y = citation))

user_agent     Set user agent.

Description
  Override the default RCurl user agent of NULL

Usage
  user_agent(agent)

Arguments
  agent     string giving user agent

See Also
  Other config: add_headers, authenticate, config, set_cookies, timeout, use_proxy, verbose

Examples
  GET("http://httpbin.org/user-agent")
  GET("http://httpbin.org/user-agent", user_agent("httr"))

use_proxy     Use a proxy to connect to the internet.

Description
  Use a proxy to connect to the internet.

Usage
  use_proxy(url, port = NULL, username = NULL, password = NULL, auth = "basic")
**Arguments**

- **url**, `port`  
  location of proxy

- **username**, `password`  
  login details for proxy, if needed

- **auth**  
  type of HTTP authentication to use. Should be one of the following: basic, digest, digest_ie, gssnegotiate, ntlm, any.

**See Also**

Other config: `add_headers`, `authenticate`, `config`, `set_cookies`, `timeout`, `user_agent`, `verbose`

**Examples**

```bash
# See http://www.hidemyass.com/proxy-list for a list of public proxies
# to test with
# GET("http://had.co.nz", use_proxy("64.251.21.73", 8080), verbose())
```

---

**Description**

Use an arbitrary verb.

**Usage**

```bash
VERB(verb, url = NULL, config = list(), ..., body = NULL,
    encode = c("multipart", "form", "json", "raw"), handle = NULL)
```

**Arguments**

- **verb**  
  Name of verb to use.

- **url**  
  the url of the page to retrieve

- **config**  
  Additional configuration settings such as http authentication (`authenticate`), additional headers (`add_headers`), cookies (`set_cookies`) etc. See `config` for full details and list of helpers.

- **body**  
  One of the following:
  - `FALSE`: No body. This is typically not used with POST, PUT, or PATCH, but can be useful if you need to send a bodyless request (like GET) with `VERB()`.
  - `NULL`: An empty body
  - "": A length 0 body
upload_file("path/"): The contents of a file. The mime type will be guessed from the extension, or can be supplied explicitly as the second argument to upload_file()

- A character or raw vector: sent as is in body. Use content_type to tell the server what sort of data you are sending.
- A named list: See details for encode.

code

If the body is a named list, how should it be encoded? Can be one of form (application/x-www-form-urlencoded), multipart, (multipart/form-data), or json (application/json).
For "multipart", list elements can be strings or objects created by upload_file. For "form", elements are coerced to strings and escaped, use I() to prevent double-escaping. For "json", parameters are automatically "unboxed" (i.e. length 1 vectors are converted to scalars). To preserve a length 1 vector as a vector, wrap in I(). For "raw", either a character or raw vector. You’ll need to make sure to set the content_type() yourself.

handle
The handle to use with this request. If not supplied, will be retrieved and reused from the handle_pool based on the scheme, hostname and port of the url. By default httr requests to the same scheme/host/port combo. This substantially reduces connection time, and ensures that cookies are maintained over multiple requests to the same host. See handle_pool for more details.

See Also
Other http methods: BROWSE, DELETE, GET, HEAD, PATCH, POST, PUT

Examples

r <- VERB("PROPFIND", "http://svn.r-project.org/R/tags/",
   add_headers(depth = 1), verbose())
stop_for_status(r)
content(r)

VERB("POST", url = "http://httpbin.org/post")
VERB("POST", url = "http://httpbin.org/post", body = "foobar")

verbose

Give verbose output.

Description

A verbose connection provides much more information about the flow of information between the client and server.

Usage

verbose(data_out = TRUE, data_in = FALSE, info = FALSE, ssl = FALSE)
Arguments

data_out Show data sent to the server.
data_in Show data received from the server.
info Show informational text from curl. This is mainly useful for debugging https and auth problems, so is disabled by default.
ssl Show even data sent/received over SSL connections?

Prefixes

verbose() uses the following prefixes to distinguish between different components of the http messages:

- * informative curl messages
- -> headers sent (out)
- => data sent (out)
- => ssl data sent (out)
- <- headers received (in)
- <= data received (in)
- <= ssl data received (in)

See Also

with_verbose() makes it easier to use verbose mode even when the requests are buried inside another function call.

Other config: add_headers, authenticate, config, set_cookies, timeout, use_proxy, user_agent

Examples

GET("http://httpbin.org", verbose())
GET("http://httpbin.org", verbose(info = TRUE))

f <- function() {
  GET("http://httpbin.org")
}

with_verbose(f())
with_verbose(f(), info = TRUE)

# verbose() makes it easy to see exactly what POST requests send
POST_verbose <- function(body, ...) {
  POST("https://httpbin.org/post", body = body, verbose(), ...)
  invisible()
}

POST_verbose(list(x = "a", y = "b"))
POST_verbose(list(x = "a", y = "b"), encode = "form")
POST_verbose(FALSE)
POST_verbose(NULL)
POST_verbose(""")
POST_verbose("xyz")
with_config

Execute code with configuration set.

Description

Execute code with configuration set.

Usage

with_config(config = config(), expr, override = FALSE)

with_verbose(expr, ...)

Arguments

config  Settings as generated by `add_headers, set_cookies or authenticate`.
expr  code to execute under specified configuration
override  if TRUE, ignore existing settings, if FALSE, combine new config with old.
...  Other arguments passed on to `verbose`

See Also

Other ways to set configuration: `config, set_config`

Examples

```r
with_config(VERBOSE, {
  GET("http://had.co.nz")
  GET("http://google.com")
})
```

# Or even easier:
```r
with_verbose(GET("http://google.com"))
```

write_disk

Control where the response body is written.

Description

The default behaviour is to use `write_memory()`, which caches the response locally in memory. This is useful when talking to APIs as it avoids a round-trip to disk. If you want to save a file that’s bigger than memory, use `write_disk()` to save it to a known path.
write_stream

Usage

write_disk(path, overwrite = FALSE)

write_memory()

Arguments

path Path to content to.
overwrite Will only overwrite existing path if TRUE.

Examples

tmp <- tempfile()
r1 <- GET("https://www.google.com", write_disk(tmp))
readLines(tmp)

# The default
r2 <- GET("https://www.google.com", write_memory())

# Save a very large file
## Not run:
GET("http://www2.census.gov/acs2011_5yr/pums/csv_pus.zip",
    write_disk("csv_pus.zip"), progress())

## End(Not run)

write_stream Process output in a streaming manner.

Description

This is the most general way of processing the response from the server - you receive the raw bytes as they come in, and you can do whatever you want with them.

Usage

write_stream(f)

Arguments

f Callback function. It should have a single argument, a raw vector containing the bytes received from the server. This will usually be 16k or less. The return value of the function is ignored.
Examples

write_stream(function(x) {
  print(length(x))
  length(x)
})
)
