Package ‘intsyv’

November 8, 2017

Version 2.1
Type Package
Title International Assessment Data Manager
Date 2017-11-08
Author Daniel Caro <daniel.caro@education.ox.ac.uk>, Przemyslaw Biecek <przemyslaw.biecek@gmail.com>
Maintainer Daniel Caro <daniel.caro@education.ox.ac.uk>
Description Provides tools for importing, merging, and analysing data from international assessment studies (TIMSS, PIRLS, PISA, ICILS, and PIAAC).
License GPL-2
URL http://users.ox.ac.uk/~educPRWY

Description

Provides tools for importing, merging, and analysing data from international assessment studies (TIMSS, PIRLS, PISA, and PIAAC and others)

Details

Package: intsvy
Type: Package
Version: 2.1
Date: 2017-11-08
License: GPL-2

intsvy allows useRs to work with international assessment data (e.g., TIMSS, PIRLS, PISA, ICILS, and PIAAC). The data is publicly available @ rms.iea-dpc.org and www.oecd.org/pisa in SPSS format. Data and merge functions print variable labels and the name of participating countries in international assessments as well as import data directly into R for the variables in student, parent, school, and teacher instruments and countries selected by the useR. Analysis functions, including mean statistics, standard deviations, regression estimates, correlation coefficients, and frequency tables, calculate point estimates and standard errors that take into account the complex sample design (i.e., replicate weights) and rotated test forms (i.e., plausible achievement values).

Author(s)

Daniel Caro <daniel.caro@education.ox.ac.uk>, Przemyslaw Biecek <przemyslaw.biecek@gmail.com>

PISA, PIAAC, PIRLS, and TIMSS Technical Reports
### configs

**Config files for intsvy studies**

**Description**

Each config file describes detailed study meta-data. Such meta data defined names of columns with weights, type of weighting, number of plausible values and other study parameters. Most of intsvy functions require such config objects.

**Usage**

```r
pisa_conf
```

**Format**

A list with three components - input, variables and parameters.

### intsvy.ben.pv

**Performance international benchmarks and proficiency levels**

**Description**

intsvy.ben.pv calculates the percentage of students performing at or above the cut-off points (scores) given by the useR. The default are the benchmarks established by official reports.

**Usage**

```r
intsvy.ben.pv(pvlabel, by, cutoff, data, export = FALSE, name = "output", folder = getwd(), config)
```

**Arguments**

- `pvlabel`: The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- `cutoff`: The cut-off points for the assessment benchmarks (e.g., `c(357.77, 420.07, 482.38, 544.68, 606.99, 669.30)`).
- `by`: The label for the grouping variable, usually the countries (i.e., `by="IDCNTRYL"`), but could be any other categorical variable.
- `data`: An R object, normally a data frame, containing the data from PIRLS.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.
- `config`: Object with configuration of a given study. Should contain the slot 'prefixes' with prefixes of filenames with the student, home, school, and teacher data.
Value

pirls.ben.pv returns a data frame with the percentage of students at or above the benchmark and the corresponding standard error.

See Also

timss.ben.pv, pirls.ben.pv, pisa.ben.pv

Examples

### Not run:

```r
pisa.ben.pv(pvlabel="MATH", by="CNT", data=student2012)
pisa.ben.pv(pvlabel="MATH", by="CNT", data=student2012, config=pisa_conf)

piaac.ben.pv(pvlabel="LIT", by="CNTRYID", data=piaac)
intsvy.ben.pv(pvlabel="LIT", by="CNTRYID", data=piaac, config=piaac_conf)

timss.ben.pv(pvlabel="ASMMAT", by="IDCNTRYL", data=timss4)
intsvy.ben.pv(pvlabel="ASMMAT", by="IDCNTRYL", data=timss4, config=timss4_conf)
```

### End(Not run)

---

**intsvy.config**

*Config files for intsvy studies*

**Description**

`intsvy.config` set non standard parameters for intsvy functions. It also allows to apply intsvy functions to new studies that are similar to PIRLS, TIMSS, PISA, PIAAC, ICILS.

**Usage**

`intsvy.config(variables.pvlabelpref,`  
`variables.pvlabelsuffix,`  
`variables.weight,`  
`variables.jackknifeZone,`  
`variables.jackknifeRep,`  
`parameters.cutoffs,`  
`parameters.cutoffs2,`  
`parameters.percentiles,`  
`parameters.weights,`  
`parameters.PVreps,`  
`input.type,`  
`input.prefixes,`  
`input.student,`  
`input.student_colnames1,`  
`input.student_colnames2,`  
`input.student_pattern,`
input.home
input.home_colnames
input.school
input.school_colnames
input.teacher
input.teacher_colnames
input.student_ids
input.school_ids
input.type_part
input.cnt_part, base.config = pirls_conf)

Arguments

parameters.weights
Weighting scheme. It may be "JK" for studies like PIRLS, ICLS, TIMSS, or
"BRR" for studies like PISA or "mixed_piaac" for studies with mixed design
like PIAAC.

parameters.cutoffs2, parameters.cutoffs
Cut offs for plausible values, either for benchmark or for logistic regression.

parameters.percentiles, parameters.PVreps
Other parameters for weighting schemes, like number of PVs.

variables.pvlabelpref, variables.pvlabelsuffix, variables.weight, variables.jackknifeZone, variables.
Names of variables that are used for jack-knife replicates.

input.type, input.prefixes, input.student, input.student_colnames1, input.student_colnames2, input.
Parameters to correctly read data from files downloaded from ieu.nl website.

base.config Base config structure, either pirls_conf, pisa_conf, piaac_conf, timss4_conf,
timss8_conf, icil_conf.

Value

intsy.config returns new object with parameters. It is a list with three components - input, variables
and parameters.

Examples

## Not run:
icils_conf <- intsy.config(input.student_pattern = "^PV[0-5]C1L$",
 parameters.cutoffs2 = 550, intsy::pirls_conf)
icils_conf

## End(Not run)
**Description**

`intsdy.log` performs logistic regression analysis for an observed dependent variable (NOT for plausible values).

**Usage**

```r
intsdy.log(y, x, by, data, export = FALSE, name = "output",
          folder = getwd(), config)
```

**Arguments**

- **y**: Label for dependent variable
- **x**: Data labels of independent variables (e.g., `x = c("ASDHEHLA", "ITSEX")`).
- **by**: The label for the grouping variable, usually the countries (i.e., `by="IDCNTRYL"`), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.
- **config**: Object with configuration of a given study. Should contain the slot 'prefixes' with prefixes of filenames with the student, home, school, and teacher data.

**Value**

`pirls.log` prints a data frame with coefficients, standard errors, t-values, and odds ratios. Results are stored in a list object of class "intsdy.reg".

**See Also**

`timss.log`, `pirls.log`, `pisa.log`

**Examples**

```r
## Not run:
# Table IV.5.14, p. 457 International Report 2012

pisa12$SKIP[(pisa12$ST09Q01 == "None" & pisa12$ST115Q01 == "None")][-1] <- 1
pisa12$SKIP[(pisa12$ST09Q01 == "None" & pisa12$ST115Q01 == "None")][-1] <- 0
pisa12$LATE[(pisa12$ST08Q01=="None")][-1] <- 1
pisa12$LATE[(pisa12$ST08Q01=="None")][-1] <- 0
```
intsvy.log.pv

Logistic regression analysis with plausible values

Description

intsvy.log.pv performs logistic regression with plausible values and replicate weights.

Usage

intsvy.log.pv(pvlabel, x, cutoff, by, data, export=FALSE, name = "output", folder=getwd(), config)

Arguments

- **pvlabel**: The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- **x**: Data labels of independent variables.
- **cutoff**: The cut-off point at which the dependent plausible values scores are dichotomised (1 is larger than the cut-off).
- **by**: The label for the categorical grouping variable (i.e., by="IDCNTRYL") or variables (e.g., x=c("IDCNTRYL", "ITSEX")).
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.
- **config**: Object with configuration of a given study. Should contain the slot 'prefixes' with prefixes of filenames with the student, home, school, and teacher data.
Value
intsvy.log.pv returns a data frame with coefficients, standard errors, t-values, and odds ratios. If
"by" is specified, results are reported in a list. Weights, e.g. "TOTWGT" for PIRLS, are defined in
the config argument.

See Also
pisa.log.pv, pirls.log.pv, timss.log.pv

Examples
## Not run:
intsvy.log.pv(pvlabel="MATH", cutoff=606.99, x="ESCS", by="IDCTRYL",
data=pisa, config=pisa_conf)
intsvy.log.pv(pvlabel="BSMMAT", cutoff=550, x="ITSEX", by="IDCTRYL",
data=timss8g, config=timss8_conf)

## End(Not run)

intsvy.mean

*Calculates mean of variable*

Description
Calculates mean and standard error of observed variable (NOT one with plausible values).

Usage

```r
intsvy.mean(variable, by, data, export = FALSE,
            name = "output", folder = getwd(), config)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>The label corresponding to the observed variable, for example, &quot;AGE_R&quot; for age of respondent.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;CNTRYID&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PIAAC.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
<tr>
<td>config</td>
<td>Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.</td>
</tr>
</tbody>
</table>
intsvy.mean.pv

**Value**

intsvy.mean returns a data frame with means and standard errors.

**See Also**

pisa.mean, timss.mean, pirls.mean

**Examples**

```r
## Not run:
intsvy.mean(variable="READHOME", by="CNTRYID", data=piaac, config=piaac_conf)
intsvy.mean(variable="PARED", by="IDCNTRYL", data=pisa, config=pisa_conf)
intsvy.mean(variable="BSBGSLM", by="IDCNTRYL", data=timss8g, config=timss8_conf)
intsvy.mean(variable="ASBHLEA", by = 'IDCNTRYL', data=pirls, config=pirls_conf)
## End(Not run)
```

**Description**

The function intsvy.mean.pv uses plausible values to calculate the mean achievement score and its standard error.

**Usage**

```r
intsvy.mean.pv(pvnames, by, data, export=FALSE, name = "output", folder=getwd(), config)
```

**Arguments**

- `pvnames`: The names of columns corresponding to the achievement score, for example, `paste0("PV",1:5,"MATH")` for PISA.
- `by`: The label for the grouping variable, usually the countries (e.g., `by="CNTRYID"`), but could be any other categorical variable.
- `data`: An R object, normally a data frame.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.
- `config`: Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.

**Value**

intsvy.mean.pv returns a data frame with means and standard errors.
See Also

pisa.mean.pv, timss.mean.pv, pirls.mean.pv

Examples

## Not run:
```r
intsvy.mean.pv(pvnames = paste0("ASRREA0",1:5), by = "IDCNTRYL",
data = pirls, config = pirls_conf)
```
```r
intsvy.mean.pv(pvnames = paste0("PV",1:5,"MATH"), by = "CNT",
data = student2012,
config = pisa_conf)
```
```r
intsvy.mean.pv(pvnames = paste0("BSMMAT0",1:5), by = "IDCNTRYL",
data = timss8g,
config = timss8_conf)
```
```r
intsvy.mean.pv(pvnames = paste0("PVNUM", 1:10), by = "CNTRYID",
data = piaac,
config = piaac_conf)
```
## End(Not run)

### intsvy.per.pv

#### INTSVY percentiles

**Description**

Calculates percentiles for plausible values.

**Usage**

```r
intsvy.per.pv(pvlabel, by, per, data, export = FALSE, name = "output",
folder = getwd(), config)
```

**Arguments**

- `pvlabel`: The label corresponding to the achievement variable, for example, "BSMMAT", for overall mathematics performance.
- `per`: User-defined percentiles (e.g., `per = c(5, 10, 25, 75, 90, 95)`).
- `by`: The label of the categorical grouping variable (e.g., `by="IDCNTRYL"`) or variables (e.g., `by=c("IDCNTRYL", "ITSEX")`).
- `data`: An R object, normally a data frame, containing the data from intsvy studies.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.
- `config`: Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.
Value

`intsvy.per.pv` returns a data frame with percentiles and associated standard errors. Default weights (e.g. "TOTWGT" in TIMSS) and percentiles are specified in the `config` parameter.

See Also

`pisa.per.pv`, `pirls.per.pv`, `timss.per.pv`

Examples

```r
## Not run:
timss.per.pv(pvlabel = "BSMMAT", per = c(5, 10, 25, 50, 75, 90, 95), by = "IDCNTRYL", data = timss8)
intsvy.per.pv(pvlabel = "BSMMAT", by = "IDCNTRYL", data = timss8, config = timss8_conf)

pirls.per.pv(pvlabel = "ASRREA", by = "IDCNTRYL", data = pirls)
intsvy.per.pv(pvlabel = "ASRREA", per = c(5, 10, 25, 50, 75, 90, 95), by = "IDCNTRYL", data = pirls, config = pirls_conf)

pisa.per.pv(pvlabel = "MATH", per = c(10, 25, 75, 90), by = "CNT", data = student2012)
intsvy.per.pv(pvlabel = "MATH", by = "CNT", data = student2012, config = pisa_conf)
## End(Not run)
```

---

**intsvy.reg**  
*Regression analysis without plausible values*

Description

`intsvy.reg` performs linear regression analysis (OLS) for an observed dependent variable (NOT for plausible values)

Usage

```r
intsvy.reg(y, x, by, data, export = FALSE, name = "output", folder = getwd(), config)
```

Arguments

- `y`  
  Label for dependent variable.
- `x`  
  Data labels of independent variables.
- `by`  
  The label for the grouping variable, usually the countries (i.e., `by = "CNTRYID"`), but could be any other categorical variable.
- `data`  
  An R object, normally a data frame, containing the data.
- `export`  
  A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`  
  The name of the exported file.
**intsy.reg.pv**

folder
The folder where the exported file is located.

config
Object with configuration of a given study. Should contain the slot `prefixes` with prefixes of filenames with the student, home, school, and teacher data.

**Value**

`intsy.reg` returns a data frame with coefficients, standard errors and t-values. If "by" is specified, results are reported in a list. If the "by" argument is set, then the returning object is of the class "intsy.reg" with overloaded function plot().

**See Also**

`pisa.reg`, `pirls.reg`, `timss.reg`

**Examples**

```r
## Not run:
# install pbiecek/PIAAC package from github to have access to piaac data
piaac.reg(y="AGE_R", x="GENDER_R", by="CNRTRYID", data=piaac)
## End(Not run)
```

---

**Description**

`intsy.reg.pv` performs linear regression analysis (OLS) with plausible values and replicate weights.

**Usage**

```r
intsy.reg.pv(x, pvlabel, by,
data, std=FALSE, export = FALSE, name = "output", folder = getwd(), config)
```

**Arguments**

- `pvlabel` The label corresponding to the achievement variable, for example, "BSMMAT", for overall math performance in TIMSS Grade 8.
- `x` Data labels of independent variables.
- `by` The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- `data` An R object, normally a data frame, containing the data from TIMSS.
- `std` A logical value. If TRUE standardised regression coefficients are calculated.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
**intsvy.rho**

folder

The folder where the exported file is located.

config

Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.

**Value**

`intsvy.reg.pv` prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores different regression output including residuals, replicate coefficients, variance within and between, and the regression data.frame in a list object of class "intsvy.reg".

**See Also**

`piaac.reg.pv`, `pirls.reg.pv`, `pisa.reg.pv`, `timss.reg.pv`

**Examples**

```r
## Not run:
intsvy.reg.pv(pvlabel="MATH", x="ST04Q01", by = "IDCNTRYL", data=pisa, config=pisa_conf)
intsvy.reg.pv(pvlabel="LIT", x="GENDER_R", by = "CNTRYID", data=piaac, config=piaac_conf)
intsvy.reg.pv(pvlabel="BSMMAT", by="IDCNTRYL", x="ITSEX", data=timss8g, config=timss8_conf)
intsvy.reg.pv(pvlabel="ASRREA", by="IDCNTRYL", x="ITSEX", data=pirls, config=pirls_conf)
## End(Not run)
```

**intsvy.rho**

**Correlation matrix**

**Description**

`intsvy.rho` produces a correlation matrix for observed variables (NOT for plausible values)

**Usage**

`intsvy.rho(variables, by, data, export = FALSE, name = "output", folder = getwd(), config)`

**Arguments**

variables

Data labels for the variables in the correlation matrix (e.g., `variables=c("ASRREA01", "ASDAGE")`)

by

The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.

data

An R object, normally a data frame, containing the data from PIRLS.

export

A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

name

The name of the exported file.

folder

The folder where the exported file is located.

config

Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.
intsrvy.rho.pv

Value

intsrvy.rho returns a matrix including correlation and standard error values.

See Also

timss.rho, pirls.rho.pv, timss.rho.pv

Examples

## Not run:
pirls.rho(variables=c("ASRREA01", "ASDAGE"), by="IDCNTRYL", data=pirls)

## End(Not run)

## intsvy.rho.pv  Two-way weighted correlation with plausible values

Description

intsrvy.rho.pv calculates the correlation and standard error among two achievement variables each based on 5 plausible values or one achievement variable and an observed variable (i.e., with observed scores rather than plausible values).

Usage

intsrvy.rho.pv(variable, pvlabels, by, data, export=FALSE, name= "output", folder=getwd(), config)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>A data label for the observed variable</td>
</tr>
<tr>
<td>pvlabels</td>
<td>One or two labels describing the achievement variables.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;IDCNTRYL&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
<tr>
<td>config</td>
<td>Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.</td>
</tr>
</tbody>
</table>

Value

intsrvy.rho returns a matrix including correlation and standard error values.
**intsvy.select.merge**

Select and merge data

**Description**

intsvy.select.merge selects and merges data from different international assessment studies. It was developed and it is particularly handy for importing IEA data since original files are organised by instrument, country, grade, etc., in a large number of files. Achievement and weight variables (all of them) are selected by default.

**Usage**

```r
intsvy.select.merge(folder = getwd(), countries, student = c(), home, school, teacher, config)
```

**Arguments**

- `folder` Directory path where the data are located. The data could be organised within folders but duplicated files should be avoided.
- `countries` The selected countries, supplied with the abbreviation (e.g., countries=c("AUT", "BGR")) or codes (countries=c(40, 100)). If no countries are selected, all are selected.
- `student` The data labels for the selected student variables.
- `home` The data labels for the selected home background variables.
- `school` The data labels for the selected school variables.
- `teacher` The data labels for the selected teacher data.
- `config` Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.

**Value**

intsvy.select.merge returns a data frame with the selected data from study defined in config file.

**See Also**

timssg4.select.merge, timssg8.select.merge, pisa.select.merge

---

**Examples**

```r
## Not run:
intsvy.select.merge(folder = getwd(), countries=c("AUT", "BGR"),
                      student = c("BSEDUP"), pweight="BSMMAT", by="IDCNTRYL",

# End(Not run)
```

**Description**

`intsvy.table` produces a frequency table for a categorical variable printing percentages and standard errors.

**Usage**

`intsvy.table(variable, by, data, config)`
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>The data label with the variable to be analysed.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;IDCNTRYL&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PISA.</td>
</tr>
<tr>
<td>config</td>
<td>Object with configuration of a given study. Should contain the slot ‘prefixes’ with prefixes of filenames with the student, home, school, and teacher data.</td>
</tr>
</tbody>
</table>

Value

Intsvy.table returns a data frame with percentages and standard errors.

See Also

timss.table, pirls.table

Examples

```r
## Not run:
intsvy.table(variable="ASDGSLM", by="IDCNTRYL", data=timss4,
              config = intsvy::timss_conf)
intsvy.table(variable="ST08Q01", by="CNT", data=pisa, config=pisa_conf)

## End(Not run)
```

---

**intsvy.var.label**

*Data labels*

**Description**

Intsvy.var.labels prints and saves variable labels and names of participating countries in a text file. The function is called by timssg4.var.label, timssg8.var.label, pirls.var.label and pisa.var.label.

**Usage**

```r
intsvy.var.label(folder = getwd(), name = "Variable labels", output = getwd(),
                  config)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>folder</td>
<td>Directory path where the data files are located. The data could be organized within folders but duplicated files should be avoided. It is assumed that data is in ‘sav’ files. For TIMSS, PIRLS and ICILS studies the data can be downloaded from <a href="http://rms.iea-dpc.org/">http://rms.iea-dpc.org/</a>.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the output file.</td>
</tr>
</tbody>
</table>
output
config

Folder where the output file is located.
Object with configuration of a given study. Should contain the slot ‘prefixes’
with prefixes of filenames with the student, home, school, and teacher data.

Value

intsvy.var.label returns a list with variable labels for the student, home, school, and teacher
data (if applied).

See Also

timssg4.var.label, timssg8.var.label, pirls.var.label, pisa.var.label

Examples

```r
## Not run:
intsvy.var.label(folder = getwd(), config = pirls_conf)
intsvy.var.label(folder = getwd(), config = timss8_conf)
intsvy.var.label(folder = getwd(), config = icils_conf)
intsvy.var.label(folder = getwd(), config = piaac_conf)

## End(Not run)
```

Description

Calculates percentage of population at each proficiency level defined by PIAAC. Or at proficiency
levels provided by the user.

Usage

```r
piaac.ben.pv(pvlabel, by, data, cutoff, export=FALSE,
name= "output", folder=getwd())
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pvlabel</td>
<td>The label corresponding to the achievement variable, for example, &quot;LIT&quot;, for overall reading performance.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;COUNTRYID&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>cutoff</td>
<td>The cut-off points for the assessment benchmarks (e.g., cutoff= c(357.77, 420.07, 482.38, 544.68, 606.99, 669.30)).</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PIAAC.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
</tbody>
</table>
piaac.mean

Value

piaac.ben.pv returns a data frame with the percentage of students at each proficiency level and its corresponding standard error.

The total weight, "TOTWGT" and the cut-off points or benchmarks are defined in the config object.

See Also

timss.ben.pv, pirls.ben.pv, pisa.ben.pv

Examples

## Not run:
#Table A2.5
#Percentage of adults scoring at each proficiency level in numeracy
piaac.ben.pv(pvlabel="NUM", by="CNTRYID", data=piaac)
#Table A2.1
#Percentage of adults scoring at each proficiency level in literacy
piaac.ben.pv(pvlabel="LIT", by="CNTRYID", data=piaac)

## End(Not run)

---

**piaac.mean**  
*Calculates mean of variable in PIAAC data*

Description

Calculates the mean of an observed variable (NOT one with plausible values) and its standard error.

Usage

piaac.mean(variable, by, data, export = FALSE,  
name = "output", folder = getwd())

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>The label corresponding to the observed variable, for example, &quot;AGE_R&quot; for age of respondent.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;CNTRYID&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PIAAC.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
</tbody>
</table>
piaac.mean.pv

Value

piaac.mean returns a data frame with means and standard errors.

See Also

pisa.mean, timss.mean, pirls.mean

Examples

```
## Not run:
# install pbiecek/PIAAC package from github to have access to piaac data
piaac.mean(variable="AGE_R", by="CNTRYID", data=piaac)

## End(Not run)
```

piaac.mean.pv

Calculates mean achievement score for PIAAC data

Description

piaac.mean.pv uses ten plausible values to calculate the mean achievement score and its standard error.

Usage

```
piaac.mean.pv(pvlabel, by, data, export = FALSE, name = "output", folder = getwd())
```

Arguments

- `pvlabel` The label corresponding to the achievement variable, for example, "LIT", for overall literacy performance, "NUM" for numeracy, "PSL" for problem solving.
- `by` The label for the grouping variable, usually the countries (i.e., by="CNTRYID"), but could be any other categorical variable.
- `data` An R object, normally a data frame, containing the data from PIAAC.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
- `folder` The folder where the exported file is located.

Value

piaac.mean.pv returns a data frame with the mean values and standard errors.

See Also

pisa.mean.pv, timss.mean.pv, pirls.mean.pv
Examples

## Not run:
# install piecek/PIAAC package from github to have access to piaac data
piaac.mean.pv(pvlabel = "LIT", by = "CNTRYID", data = piaac)
piaac.mean.pv(pvlabel = "NUM", by = c("CNTRYID", "GENDER_R"), data = piaac)

## End(Not run)

piaac.reg  Regression analysis for PIAAC

Description

piaac.reg performs linear regression analysis (OLS) for an observed dependent variable (NOT for plausible values)

Usage

piaac.reg(y, x, by, data, export = FALSE, name = "output", folder = getwd())

Arguments

- **y**: Label for dependent variable.
- **x**: Data labels of independent variables.
- **by**: The label for the grouping variable, usually the countries (i.e., by="CNTRYID"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIAAC.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

Value

piaac.reg returns a data frame with coefficients, standard errors and t-values. If "by" is specified, results are reported in a list. If the "by" argument is set, then the returning object is of the class "intsvy.reg" with overloaded function plot().

See Also

pisa.reg, pirls.reg, timss.reg
piaac.reg.pv

Examples

```r
## Not run:
# install pkiecek/PIAAC package from github to have access to piaac data
piaac.reg(y="AGE_R", x="GENDER_R", by="CNTRYID", data=piaac)

## End(Not run)
```

---

piaac.reg.pv  
Regression analysis with plausible values for PIAAC

Description

piaac.reg.pv performs linear regression analysis (OLS) with plausible values and replicate weights.

Usage

```r
piaac.reg.pv(x, pvlabel = "LIT", by, data,
export = FALSE, name = "output", std=FALSE, folder = getwd())
```

Arguments

- `x`: Data labels of independent variables.
- `pvlabel`: The label corresponding to the achievement variable, for example, "LIT", for overall literacy performance, "NUM" for numeracy, "PSL" for problem solving.
- `by`: The label for the grouping variable, usually the countries (i.e., by="CNTRYID"), but could be any other categorical variable.
- `data`: An R object, normally a data frame, containing the data from PIAAC.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `std`: A logical value. If TRUE standardised regression coefficients are calculated.
- `folder`: The folder where the exported file is located.

Value

piaac.reg.pv returns a data frame with coefficients, standard errors and t-values. If "by" is specified, results are reported in a list. If the "by" argument is set, then the returning object is of the class "intsvy.reg" with overloaded function plot().

## End(Not run)

---

piaac.table | Frequency table

**Description**

piaac.table produces a frequency table for a categorical variable printing percentages and standard errors.

**Usage**

piaac.table(variable, by, data, export = FALSE, name = "output", folder = getwd())

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>The data label with the variable to be analysed.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;CNTRYID&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PIAAC.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
</tbody>
</table>

**Value**

piaac.table returns a data frame with percentages and standard errors.

**See Also**

pisa.table, timss.table, pirls.table

**Examples**

## Not run:
# install pbiecek/PIAAC package from github to have access to piaac data
piaac.table(variable="I_Q06A", by="CNTRYID", data=piaac)
piaac.table(variable="GENDER_R", by="CNTRYID", data=piaac)

## End(Not run)
Description

`pirls.ben.pv` calculates the percentage of students performing at or above the cut-off points (scores) given by the user. The default are the benchmarks established by PIRLS/TIMSS.

Usage

```r
pirls.ben.pv(pvlabel, by, cutoff, data, export = FALSE, name = "output", folder = getwd())
```

Arguments

- `pvlabel`: The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- `cutoff`: The cut-off points for the assessment benchmarks (e.g., `c(400, 475, 550, 625)`).
- `by`: The label for the grouping variable, usually the countries (i.e., `by="IDCNTRYL"`), but could be any other categorical variable.
- `data`: An R object, normally a data frame, containing the data from PIRLS.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.

Value

`pirls.ben.pv` returns a data frame with the percentage of students at or above the benchmark and the corresponding standard error.

The total weight, "TOTWGT" and the cut-off points or benchmarks are defined in the config object.

See Also

`timss.ben.pv, pisa.ben.pv`

Examples

```r
# Not run:
pirls.ben.pv(pvlabel="ASRREA", by="IDCNTRYL", data=pirls)

# End(Not run)
```
Description

pirls.log performs logistic regression analysis for an observed dependent variable (NOT for plausible values).

Usage

pirls.log(y, x, by, data, export = FALSE,
name = "output", folder = getwd())

Arguments

y Label for dependent variable
x Data labels of independent variables (e.g., x = c("ASDHEHLA", "ITSEX"))
by The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
data An R object, normally a data frame, containing the data from PIRLS.
export A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name The name of the exported file.
folder The folder where the exported file is located.

Value

pirls.log prints a data frame with coefficients, standard errors, t-values, and odds ratios. Results are stored in a list object of class "intsdy.reg".

## End(Not run)

---

**Description**

pirls.log.pv performs logistic regression with plausible values and replicate weights.

**Usage**

pirls.log.pv(pvlabel="ASRREA", x, cutoff, by,
data, export=FALSE, name="output", folder=getwd())

**Arguments**

- **pvlabel**: The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- **x**: Data labels of independent variables.
- **cutoff**: The cut-off point at which the dependent plausible values scores are dichotomised (1 is larger than the cut-off).
- **by**: The label for the categorical grouping variable (i.e., by="IDCNTRYL") or variables (e.g., x= c("IDCNTRYL", "ITSEX")).
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

**Value**

pirls.log.pv returns a data frame with coefficients, standard errors, t-values, and odds ratios. If "by" is specified, results are reported in a list.

### pirls.mean

`Calculates mean of variable`

Description

Calculates the mean of an observed variable (NOT one with plausible values) and its standard error.

Usage

```
pirls.mean(variable, by, data, export = FALSE, name = "output", folder = getwd())
```

Arguments

- **variable**: The label corresponding to the observed variable, for example, "ASDAGE", for the age of the student.
- **by**: The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

Value

pirls.mean returns a data frame with means and standard errors.

See Also

timss.mean, pisa.mean
pirls.mean.pv

## Examples

```r
## Not run:
# PIRLS: Exhibit 2.17 User Guide PIRLS 2011, p. 28
pirls.mean(variable='ASBHELA', by= 'IDCNTRYL', data=pirls)

## End(Not run)
```

---

**pirls.mean.pv**

*Calculates mean achievement score*

---

### Description

pirls.mean.pv uses five plausible values to calculate the mean achievement score and its standard error.

### Usage

```r
pirls.mean.pv(pvlabel = "ASRREA", by,
data, export = FALSE, name = "output", folder = getwd())
```

### Arguments

- **pvlabel**: The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- **by**: The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

### Value

pirls.mean.pv returns a data frame with the mean values and standard errors.

### See Also

timss.mean.pv, pisa.mean.pv
Examples

```r
## Not run:
# PIRLS: Exhibit 2.5 User Guide PIRLS 2011, p. 15
pirls.mean.pv(pvlabel="ASRREA", by= "IDCNTRYL", data=pirls)
# PIRLS: Exhibit 2.8 User Guide PIRLS 2011, p. 18
pirls.mean.pv(pvlabel="ASRREA", by= c("IDCNTRYL", "ITSEX"), data=pirls)
```

## End(Not run)

### pirls.per.pv

**PIRLS percentiles**

**Description**

Calculates percentiles for plausible values

**Usage**

```r
pirls.per.pv(pvlabel="ASRREA", by, per, data, export=FALSE, name= "output", folder=getwd())
```

**Arguments**

- `pvlabel` The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.
- `per` User-defined percentiles (e.g., per = c(5, 10, 25, 75, 90, 95)).
- `by` The label of the categorical grouping variable (e.g., by="IDCNTRYL") or variables (e.g., by=c("IDCNTRYL", "ITSEX").
- `data` An R object, normally a data frame, containing the data from PIRLS.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
- `folder` The folder where the exported file is located.

**Value**

`pirls.per.pv` returns a data frame with percentiles and associated standard errors. Default weights (e.g. "TOTWGT" in TIMSS) and percentiles are specified in the config parameter.

**See Also**

`pisa.per.pv`, `timss.per.pv`
pirls.reg

Regression analysis

Description

pirls.reg performs linear regression analysis (OLS) for an observed dependent variable (NOT for plausible values)

Usage

pirls.reg(y, x, by, data, export = FALSE,
        name = "output", folder = getwd())

Arguments

y  Label for dependent variable
x  Data labels of independent variables (e.g., x = c("ASDHEHLA", "ITSEX") ).
by  The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"),
     but could be any other categorical variable.
data  An R object, normally a data frame, containing the data from PIRLS.
export  A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name  The name of the exported file.
folder  The folder where the exported file is located.

Value

pirls.reg prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores different regression output including residuals and replicate coefficients in a list object of class "intsvy.reg".

See Also

timss.reg
Examples

## Not run:

```

## End(Not run)

---

**pirls.reg.pv**  
*Regression analysis with plausible values*

**Description**

pirls.reg.pv performs linear regression analysis (OLS) with plausible values and replicate weights.

**Usage**

```r
pirls.reg.pv(x, pvlabel = "ASRREA", by,
  data, std=FALSE, export = FALSE, name = "output", folder = getwd())
```

**Arguments**

- **x**
  - Data labels of independent variables (e.g., `x = c("ASDHEHLA", "ITSEX")`).

- **pvlabel**
  - The label corresponding to the achievement variable, for example, "ASRREA", for overall reading performance.

- **by**
  - The label for the grouping variable, usually the countries (i.e., `by="IDCNTRYL"`), but could be any other categorical variable.

- **data**
  - An R object, normally a data frame, containing the data from PIRLS.

- **std**
  - A logical value. If TRUE standardised regression coefficients are calculated.

- **export**
  - A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

- **name**
  - The name of the exported file.

- **folder**
  - The folder where the exported file is located.
pirls.rho

Value

pirls.reg.pv prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores different regression output including residuals, replicate coefficients, variance within and between, and the regression data.frame in a list object of class "intsvy.reg".

pirls.rho  

**Correlation matrix**

Description

pirls.rho produces a correlation matrix for observed variables (NOT for plausible values)

Usage

pirls.rho(variables, by, data, export = FALSE, name = "output", folder = getwd())

Arguments

variables  

Data labels for the variables in the correlation matrix (e.g., variables=c("ASRREA01", "ASDAGE")

by  

The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.

data  

An R object, normally a data frame, containing the data from PIRLS.

export  

A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

name  

The name of the exported file.

folder  

The folder where the exported file is located.

Value

pirls.rho returns a matrix including correlation and standard error values.
See Also

  timss.rho, pirls.rho.pv, timss.rho.pv

Examples

  ## Not run:
  pirls.rho(variable=c("ASRREA01", "ASDAGE"), by="IDCNTRYL", data=pirls)

  ## End(Not run)

pirls.rho.pv  

Two-way weighted correlation with plausible values

Description

pirls.rho.pv calculates the correlation and standard error among two achievement variables each based on 5 plausible values or one achievement variable and an observed variable (i.e., with observed scores rather than plausible values).

Usage

  pirls.rho.pv(variable, pvlabels, by, data, export = FALSE, name = "output", folder = getwd())

Arguments

  variable A data label for the observed variable (e.g., variable="ASDAGE")
  pvlabels One or two labels describing the achievement variables (e.g., pvlabels = c("ASRLIT", "ASRINF") )
  by The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
  data An R object, normally a data frame, containing the data from PIRLS.
  export A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
  name The name of the exported file.
  folder The folder where the exported file is located.

Value

  pirls.rho.pv returns a matrix with correlations and standard errors.

pirls.select.merge

Examples

```r
## Not run:
# Exhibit A.15 p.309 in International report 2006
pirls.rho.pv(pvlabels=c("ASRLIT", "ASRINF"), by="IDCNTRYL", data=pirls)

## End(Not run)
```

---

pirls.select.merge  
*Select and merge data*

Description

pirls.select.merge selects and merges data from PIRLS. Achievement and weight variables (all of them) are selected by default.

Usage

```r
pirls.select.merge(folder = getwd(), countries, student = c(),
home, school, teacher)
```

Arguments

- `folder` Directory path where the data are located. The data could be organized within folders but it should not be duplicated.
- `countries` The selected countries, supplied with the abbreviation (e.g., countries=c("AUT", "BGR")) or codes (countries=c(40, 100)). If no countries are selected, all are selected.
- `student` The data labels for the selected student variables.
- `home` The data labels for the selected home background variables.
- `school` The data labels for the selected school variables.
- `teacher` The data labels for the selected teacher data.

Value

pirls.select.merge returns a data frame with the selected data from PIRLS.

See Also

timssg4.select.merge, timssg8.select.merge, pisa.select.merge
Examples

```r
## Not run:
pirls <- pirls.select.merge(folder = getwd(),
  countries = c(36, 40, 31, 957),
  student = c("ITSEX", "ASDAGE", "ASBGSMR"),
  home = c("ASDHEDUP", "ASDHOCCP", "ASDHELA", "ASBHELA"),
  school = c("ACDGDAS", "ACDGMP", "ACDG03"))

## End(Not run)
```

---

### pirls.table

#### Frequency table

**Description**

pirls.table produces a frequency table for a categorical variable printing percentages and standard errors. Information about weight is extracted from `intsvy::pirls_conf`.

**Usage**

```r
pirls.table(variable, by, data,
  export = FALSE, name = "output", folder = getwd())
```

**Arguments**

- **variable**: The data label with the variable to be analysed.
- **by**: The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

**Value**

pirls.table returns a data frame with percentages and standard errors.

**See Also**

`timss.table`, `pisa.table`
pirls.var.label

Examples

```r
## Not run:
# PIRLS: Exhibit 2.19 User Guide 2011, p. 30
pirls.table(variable="ASDHELA", by="IDCNTRYL", data=pirls)

## End(Not run)
```

---

**Description**

pirls.var.label prints and saves variable labels and names of participating countries in a text file.

**Usage**

```r
pirls.var.label(folder = getwd(), name = "Variable labels", output = getwd())
```

**Arguments**

- `folder`: Directory path where the PIRLS data are located. The data could be organized within folders but it should not be duplicated.
- `name`: Name of output file.
- `output`: Folder where output file is located.

**Value**

pirls.var.label returns a list with variable labels for the student, home, school, and teacher data.

**See Also**

timssg4.var.label, timssg8.var.label, pisa.var.label

**Examples**

```r
## Not run:
pirls.var.label(folder = getwd())

## End(Not run)
```
Description

Calculates percentage of students at each proficiency level defined by PISA. Or at proficiency levels provided by the user. Use the pisa2015.ben.pv() for data from PISA 2015 study.

Usage

```r
pisa.ben.pv(pvlabel, by, cutoff, data, export=FALSE, name= "output", folder=getwd())
pisa2015.ben.pv(pvlabel, by, cutoff, data, export=FALSE, name= "output", folder=getwd())
```

Arguments

- `pvlabel`: The label corresponding to the achievement variable, for example, "READ", for overall reading performance.
- `cutoff`: The cut-off points for the assessment benchmarks (e.g., `cutoff= c(357.77, 420.07, 482.38, 544.68, 606.99, 669.30)`).
- `by`: The label for the grouping variable, usually the countries (i.e., `by="IDCNTRYL"`), but could be any other categorical variable.
- `data`: An R object, normally a data frame, containing the data from PISA.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.

Value

pisa.ben.pv returns a data frame with the percentage of students at each proficiency level and its corresponding standard error.

The total weight, "TOTWGT" and the cut-off points or benchmarks are defined in the config object.

See Also

timss.ben.pv, pirls.ben.pv

Examples

```r
## Not run:
# Table I.2.1a, p. 298 International Report 2012 Volume I
pisa.ben.pv(pvlabel="MATH", by="IDCNTRYL", data=pisa)

## End(Not run)
Description

pisa.log performs logistic regression analysis (OLS) for an observed dependent variable (NOT for plausible values) Use the pisa2015.log() for data from PISA 2015 study.

Usage

```r
pisa.log(y, x, by, data, export=FALSE, name="output", folder=getwd())
pisa2015.log(y, x, by, data, export=FALSE, name="output", folder=getwd())
```

Arguments

- **y**: Label for dependent variable.
- **x**: Data labels of independent variables.
- **by**: The label for the grouping variable, usually the countries (i.e., by="CNT"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PISA.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

Value

pisa.log prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores replicate estimates and other regression output in a list object of class "intsvy.reg".

See Also

pirls.log, timss.log

Examples

```r
## Not run:
# Table IV.5.14, p. 457 International Report 2012

pisa12$SKIP[!(pisa12$ST09Q01 == "None" & pisa12$ST115Q01 == "None")][-1] <- 1
pisa12$SKIP[!(pisa12$ST09Q01 == "None" & pisa12$ST115Q01 == "None")][-1] <- 0

pisa12$LATE[!(pisa12$ST08Q01 == "None")][-1] <- 1
pisa12$LATE[!(pisa12$ST08Q01 == "None")][-1] <- 0

pisa.log(y="SKIP", x="LATE", by="IDCNTRYL", data = pisa12)
```
# from PISA2012lite

```r
student2012$SKIP[!(student2012$ST09Q01 == "None" & student2012$ST115Q01 == 1)] <- 1
student2012$SKIP[student2012$ST09Q01 == "None" & student2012$ST115Q01 == 1] <- 0

student2012$LATE[!student2012$ST08Q01 == "None"] <- 1
student2012$LATE[student2012$ST08Q01 == "None"] <- 0

pisa.log(y="SKIP", x="LATE", by="CNT", data = student2012)
```

## End(Not run)

---

**pisa.log.pv**

*Logistic regression analysis with plausible values*

### Description

pisa.log.pv performs logistic regression with plausible values and replicate weights. Use the pisa2015.log.pv() for data from PISA 2015 study.

### Usage

```r
pisa.log.pv(pvlabel="READ", x, by, cutoff,
  data, export=FALSE, name = "output", folder=getwd())
pisa2015.log.pv(pvlabel="READ", x, by, cutoff,
  data, export=FALSE, name = "output", folder=getwd())
```

### Arguments

- **pvlabel**: The label corresponding to the achievement variable, for example, "READ", for overall reading performance.
- **x**: Data labels of independent variables.
- **cutoff**: The cut-off point at which the dependent plausible values scores are dichotomised (1 is larger than the cut-off)
- **by**: The label for the categorical grouping variable (i.e., by="IDCNTRY") or variables (e.g., x=c("IDCNTRY", "ST79Q03")).
- **data**: An R object, normally a data frame, containing the data from PISA.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

### Value

pisa.log.pv returns a data frame with coefficients, standard errors, t-values, and odds ratios. If "by" is specified, results are reported in a list.
**pisa.mean**

*Calculates mean of variable*

**Description**

Calculates the mean of an observed variable (NOT one with plausible values) and its standard error. Use the pisa2015.mean() for data from PISA 2015 study.

**Usage**

```r
pisa.mean(variable, by, data, export = FALSE, name = "output", folder = getwd())
pisa2015.mean(variable, by, data, export = FALSE, name = "output", folder = getwd())
```

**Arguments**

- **variable**: The label corresponding to the observed variable, for example, "ESCS", for the student SES.
- **by**: The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PISA.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

**Value**

pisa.mean returns a data frame with means and standard errors.

**See Also**

timss.mean, pirls.mean, piaac.mean

---

**See Also**

- timss.log.pv, pirls.log.pv

**Examples**

```r
## Not run:
timss.log.pv(pvlabel="BSMMAT", cutoff=550, x=c("ITSEX", "BSBGSLM"), by="IDCNTRYL", data=timss8g)
intsvy.log.pv(pvlabel="BSMMAT", cutoff=550, x="ITSEX", by="IDCNTRYL",
data=timss8g, config=timss8_conf)
## End(Not run)
```
Examples

```r
# Not run:
# PISA 2012: Table II.2.3, p. 183
pisa.mean(variable = "ESCS", by = "IDCNTRYL", data = pisa)
pisa.mean(variable = "PARED", by = "IDCNTRYL", data = pisa)

# PISA 2012: Table III.2.3d, p. 252
pisa.mean(variable = "BELONG", by = "IDCNTRYL", data = pisa)
pisa.mean(variable = "BELONG", by = c("IDCNTRYL", "ST64Q01"), data = pisa)

# PISA 2015
pisa2015.mean(variable = "AGE", by = "CNT", data = stud2015)
```

```r
# End(Not run)
```

**pisa.mean.pv**  
*Calculates mean achievement score*

Description

pisa.mean.pv uses five plausible values to calculate the mean achievement score and its standard error. Use the pisa2015.mean.pv() for data from PISA 2015 study.

Usage

```r
pisa.mean.pv(pvlabel, by, data, export = FALSE, name = "output",
folder = getwd())
pisa2015.mean.pv(pvlabel, by, data, export = FALSE, name = "output",
folder = getwd())
```

Arguments

- **pvlabel**: The label corresponding to the achievement variable, for example, "READ", for overall reading performance.
- **by**: The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- **data**: An R object, normally a data frame, containing the data from PIRLS.
- **export**: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- **name**: The name of the exported file.
- **folder**: The folder where the exported file is located.

Value

pisa.mean.pv returns a data frame with the mean values and standard errors.
pisa.per.pv

See Also
timss.mean.pv, pirls.mean.pv, piaac.mean.pv

Examples

```r
## Not run:
# Table I.2.3a, p. 305 International Report 2012
pisa.mean.pv(pvlabel = "MATH", by = "IDCNTRYL", data = pisa)
pisa.mean.pv(pvlabel = "MATH", by = c("IDCNTRYL", "ST04Q01"), data = pisa)

# Table III.2.1a, p. 232, International Report 2012
pisa.mean.pv(pvlabel="MATH", by=c("IDCNTRYL", "ST08Q01"), data=pisa)

# Figure I.2.16 p. 56 International Report 2009
pisa.mean.pv(pvlabel = "READ", by = "IDCNTRYL", data = pisa)

# PISA 2015
pisa2015.mean.pv(pvlabel = "READ", by = "CNT", data = stud2015)

## End(Not run)
```

### Description

Calculates percentiles for plausible values. Use the pisa2015.per.pv() for data from PISA 2015 study.

### Usage

```r
pisa.per.pv(pvlabel="READ", by, per, data, export=FALSE, name= "output",
folder=getwd())
pisa2015.per.pv(pvlabel="READ", by, per, data, export=FALSE, name= "output",
folder=getwd())
```

### Arguments

- `pvlabel` The label corresponding to the achievement variable, for example, "READ", for overall reading performance.
- `per` User-defined percentiles (e.g., per = c(5, 10, 25, 75, 90, 95)).
- `by` The label of the categorical grouping variable (e.g., by="IDCNTRYL") or variables (e.g., by=c("IDCNTRYL", "ST79Q03")).
- `data` An R object, normally a data frame, containing the data from PISA.
pisa.reg

Regression analysis

Description

pisa.reg performs linear regression analysis (OLS) for an observed dependent variable (NOT for plausible values) Use the pisa2015.reg() for data from PISA 2015 study.

Usage

pisa.reg(y, x, by, data, export = FALSE, name = "output", folder = getwd())
pisa2015.reg(y, x, by, data, export = FALSE, name = "output", folder = getwd())

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>Label for dependent variable.</td>
</tr>
<tr>
<td>x</td>
<td>Data labels of independent variables.</td>
</tr>
<tr>
<td>by</td>
<td>The label for the grouping variable, usually the countries (i.e., by=&quot;IDCNTRYL&quot;), but could be any other categorical variable.</td>
</tr>
<tr>
<td>data</td>
<td>An R object, normally a data frame, containing the data from PISA.</td>
</tr>
<tr>
<td>export</td>
<td>A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the exported file.</td>
</tr>
<tr>
<td>folder</td>
<td>The folder where the exported file is located.</td>
</tr>
</tbody>
</table>
**Value**

`pisa.reg.pv` performs linear regression analysis (OLS) with plausible values and replicate weights. Use the `pisa2015.reg.pv()` for data from PISA 2015 study.

**Usage**

```r
pisa.reg.pv(x, pvlabel = "READ", by, data, export = FALSE, name = "output", folder = getwd(), std=FALSE)
pisa2015.reg.pv(x, pvlabel = "READ", by, data, export = FALSE, name = "output", folder = getwd(), std=FALSE)
```

**Arguments**

- `x` Data labels of independent variables.
- `pvlabel` The label corresponding to the achievement variable, for example, "READ", for overall reading performance.
- `by` The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- `data` An R object, normally a data frame, containing the data from PISA.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
- `folder` The folder where the exported file is located.
- `std` A logical value. If TRUE standardised regression coefficients are calculated.
pisa.rho

Value

pisa.reg.pv prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-twquared) and stores different regression output including residuals, replicate coefficients, variance within and between, and the regression data.frame in a list object of class "intsvy.reg".

See Also

timss.reg.pv, pirls.reg.pv, piaac.reg.pv

Examples

## Not run:
# Table I.2.3a, p. 305, International Report 2012
pisa.reg.pv(pvlabel="MATH", x="ST04Q01", by = "IDCNTRYL", data=pisa)

## End(Not run)

Description

pisa.rho produces a correlation matrix for observed variables (NOT for plausible values) Use the pisa2015.rho() for data from PISA 2015 study.

Usage

pisa.rho(variables, by, data, export=FALSE, name="output", folder=getwd())
pisa2015.rho(variables, by, data, export=FALSE, name="output", folder=getwd())

Arguments

variables Data labels for the variables in the correlation matrix (e.g., variables=c("TCHBEHTD", "TCHBEHSO"))
by The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
data An R object, normally a data frame, containing the data from PISA.
export A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name The name of the exported file.
folder The folder where the exported file is located.

Value

pisa.rho returns a matrix including correlation and standard error values.
See Also

timss.rho, pirls.rho, pirls.rho.pv, timss.rho.pv

Examples

```r
## Not run:
pisa.rho(variables=c("COGACT", "TCHBEHD", "TCHBEHSO", "CLSMA"), by="IDCNTRYL", data=pisa)
pisa2015.rho(variables=c("AGE", "PV1MATH"), by="CNT", data=stud2015)
```

## End(Not run)

---

pisa.select.merge  
Select and merge data

---

Description

pisa.select.merge selects and merges data from PISA. Achievement and weight variables (all of them) are selected by default.

Usage

```r
pisa.select.merge(folder=getwd(), student.file, parent.file=c(), school.file=c(),
countries, student=c(), parent, school)
```

Arguments

- `folder`: Directory path where the PISA data are located, if all the data are located in the same folder.
- `student.file`: Student file name if 'folder' is provided, otherwise full path name of student dataset (required argument).
- `parent.file`: Parent file name if 'folder' is provided, otherwise full path name of parent dataset.
- `school.file`: School file name if 'folder' is provided, otherwise full path name of school dataset.
- `countries`: The selected countries, supplied with the abbreviation (e.g., countries=c("DEU", "NOR"). If no countries are selected, all are selected.
- `student`: The data labels for the selected student variables.
- `parent`: The data labels for the selected parental variables.
- `school`: The data labels for the selected school variables.

Value

pisa.select.merge returns a data frame with the selected data from PISA.
See Also
timssg4.select.merge, timssg8.select.merge, pirls.select.merge

Examples

```r
## Not run:
pisa <- pisa.table(variable = "IMMIG", data = getwd(),
    export = FALSE, name = "output", folder = getwd())
```

---

### pisa.table  

**Frequency table**

**Description**

pisa.table produces a frequency table for a categorical variable printing percentages and standard errors. Use the pisa2015.table() for data from PISA 2015 study.

**Usage**

```r
pisa.table(variable, by, data, export = FALSE, name = "output", folder = getwd())
pisa2015.table(variable, by, data, export = FALSE, name = "output", folder = getwd())
```

**Arguments**

- **variable**  
The data label with the variable to be analysed.

- **by**  
The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.

- **data**  
An R object, normally a data frame, containing the data from PISA.

- **export**  
A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

- **name**  
The name of the exported file.

- **folder**  
The folder where the exported file is located.

**Value**

pisa.table returns a data frame with percentages and standard errors.
pisa.var.label

See Also
timss.table, pirls.table

Examples
```r
## Not run:
# Table A2.4a, p.274 International Report 2012 Volume I
pisa.table(variable="ST01Q01", by="IDCNTRL", data=pisa)
# Table III.2.1a, p. 232, International Report 2012 Volume III
pisa.table(variable="ST08Q01", by="IDCNTRL", data=pisa)
# PISA 2015
pisa2015.table(variable="ST04D01T", by="CNT", data=stud2015)

## End(Not run)
```

Description

pisa.var.labels prints and saves variable labels and names of participating countries in a text file

Usage

```r
pisa.var.label(folder=getwd(), student.file, parent.file=c(), school.file=c(), name="Variable labels", output=getwd())
```

Arguments

- `folder` Directory path where the PISA data are located, if all the data are located in the same folder.
- `student.file` Student file name if `folder` is provided, otherwise full path name of student dataset (required argument).
- `parent.file` Parent file name if `folder` is provided, otherwise full path name of parent dataset.
- `school.file` School file name if `folder` is provided, otherwise full path name of school dataset.
- `name` Name of output file.
- `output` Folder where output file is located.

Value

pisa.var.label returns a list with variable labels for the student, parent, and school data.

See Also
timssg4.var.label, timssg8.var.label, pirls.var.label
plot.intsvy.mean

Graphical representation of means in groups

Description
Functions pisa.mean, pisa.mean.pv, piaac.mean, piaac.mean.pv produce object of the class intsvy.mean. The function plot.intsvy.mean presents these means graphically.

Usage
## S3 method for class 'intsvy.mean'
plot(x, se = TRUE, sort = FALSE, ...)

Arguments
x  An object of the class intsvy.mean returned by pisa.mean, pisa.mean.pv, piaac.mean or piaac.mean.pv functions.
se  If TRUE add whiskers for standard errors.
sort  If TRUE groups are sorted along averages.
...  Not used. Required for cran-check.

Value
Returns object of ggplot class with dotplot. Works for one way, two-way and three-way effects.

See Also
plot.intsvy.table, plot.intsvy.reg

Examples
## Not run:
# Country averages
head(pmeansNC <- piaac.mean.pv(pvlabel="NUM", by="CNTRYID", data=piaac, export=FALSE))

# plotting country average NUM performance
plot(pmeansNC) + ggtitle("Country performance in NUM")
# without se bars, not good idea
plot(pmeansNC, se=FALSE)
# sorted, thats better
plot(pmeansNC, sort=TRUE)
# Country averages for different age groups
head(pmeansNCA <- piaac.mean.pv(pvlabel="NUM", by=c("CNTRYID", "AGEG10LFS"),
   data=piaac, export=FALSE))

# # plotting country average within
# age groups NUM performance
plot(pmeansNCA, sort=TRUE)

# Country averages for different age and gender groups (changed order)
head(pmeansNCGA <- piaac.mean.pv(pvlabel="NUM", by=c("CNTRYID", "GENDER_R", "AGEG10LFS"),
   data=piaac, export=FALSE))

# # plotting country average within
# age and gender groups NUM performance
plot(na.omit(pmeansNCGA), sort=TRUE)

## End(Not run)

plot.intsvy.reg  

---

plot.intsvy.reg  

Graphical representation of regression models in groups

Description

Functions pisa.reg, pisa.reg.pv, piaac.reg and piaac.reg.pv produce object of the class intsvy.reg. The function plot.intsvy.reg presents this list of regression models graphically.

Usage

## S3 method for class 'intsvy.reg'
plot(x, ..., vars, se = TRUE, sort = FALSE)

Arguments

x  
An object of the class intsvy.reg returned by pisa.reg, pisa.reg.pv, piaac.reg and piaac.reg.pv functions.

...  
Other arguments

vars  
Variable labels of coefficients to be plotted. If none selected all coefficients are plotted including the R-squared

se  
If TRUE add whiskers for standard errors.

sort  
If TRUE groups are sorted in alphabetical order.

Value

Returns object of ggplot class with barplot. As with other ggplot objects the plus sign "+" can be used outside this function to modify graph parameters of the returning ggplot object. Works for one way, two-way and three-way contingency tables.
plot.intsvy.table

Graphical representation of frequency tables

Description

Functions pisa.table and piaac.table produce object of the class intsvy.table. The function plot.intsvy.table presents this table graphically.

Usage

## S3 method for class 'intsvy.table'
plot(x, se=FALSE, stacked=FALSE, centered = FALSE, midpoint = NA, ...)

Arguments

- **x**: An object of the class intsvy.table returned by pisa.table or piaac.table functions.
- **se**: If TRUE add whiskers for standard errors (only for stacked=FALSE).
- **stacked**: If TRUE plot bars stacked one over another.
- **centered**: If TRUE then bars will be centered around midpoint.
- **midpoint**: A single number, which specifies the segment around which bars are centered. By default it's the middle segment calculated as (n.levels + 1)/2. If n.levels is odd then bars are centered around the beginning of the selected segment. If n.levels is even then bars are centered around the middle of the selected segment.
- **...**: Not used. Required for cran-check.

Value

Returns object of ggplot class with barplot. Works for one way, two-way and three-way contingency tables.

# age distribution in whole dataset
(ptable <- piaac.table(variable="AGEG10LFS", data=piaac))

# age distribution in whole dataset
plot(ptable)
plot(ptable, centered=TRUE)

# age distribution within countries
head(ptableC <- piaac.table(variable="AGEG10LFS", by="CNTRYID", data=piaac))

# age distribution within countries
plot(ptableC, stacked=TRUE)
plot(na.omit(ptableC), centered=TRUE)

# age distribution within countries and gender segments
head(ptableCA <- piaac.table(variable="AGEG10LFS", by=c("CNTRYID", "GENDER_R"), data=piaac))

# age distribution within countries and gender segments
plot(na.omit(ptableCA), stacked=TRUE)
plot(na.omit(ptableCA), centered=TRUE)

## End(Not run)

---

timss.ben.pv

TIMSS international benchmarks

Description

timss.ben.pv calculates the percentage of students performing at or above the cut-off points (scores) given by the useR. The default are the benchmarks established by PIRLS/TIMSS

Usage

timss.ben.pv(pvlabel, by, cutoff, data,
export = FALSE, name = "output", folder = getwd())

Arguments

pvlabel The label corresponding to the achievement variable, for example, "BSMMAT", for overall math performance.
The cut-off points for the assessment benchmarks (e.g., cutoff = c(400, 475, 550, 625)).

The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.

An R object, normally a data frame, containing the data from TIMSS.

A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

The name of the exported file.

The folder where the exported file is located.

timss.ben.pv returns a data frame with the percentage of students at or above the benchmark and the corresponding standard error.

The total weight, "TOTWGT" and the cut-off points or benchmarks are defined in the config object.

See Also

pirls.ben.pv, pisa.ben.pv

Examples

```r
## Not run:
timss.ben.pv(pvlabel="BSMMAT", by="IDCNTRYL", cutoff = c(400, 475, 550, 625), data=timss8g)
# TIMSS G4: Exhibit 2.2 International Report TIMSS 2011, p. 90
timss.ben.pv(pvlabel="AMMMAA", by="IDCNTRYL", data=timss4g)
## End(Not run)
```
Arguments

\[ y \]
Label for dependent variable

\[ x \]
Data labels of independent variables (e.g., \[ x = c( "ASDHEHLA", "ITSEX" ) \]).

\[ by \]
The label for the grouping variable, usually the countries (i.e., \[ by="IDCNTRYL" \]), but could be any other categorical variable.

\[ data \]
An R object, normally a data frame, containing the data from PIRLS.

\[ export \]
A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.

\[ name \]
The name of the exported file.

\[ folder \]
The folder where the exported file is located.

Value
timss.log prints a data frame with coefficients, standard errors, t-values, and odds ratios. Results are stored in a list object of class "intsvy.reg".

pirls.log, pisa.log

Examples

```r
## Not run:
# Table IV.5.14, p. 457 International Report 2012

pisa2$SKIP[pisa2$ST09Q01 == "None" & pisa2$ST115Q01 == "None"] <- 1
pisa2$SKIP[pisa2$ST09Q01 == "None" & pisa2$ST115Q01 == "None"] <- 0

pisa2$LATE[pisa2$ST08Q01 == "None"] <- 1
pisa2$LATE[pisa2$ST08Q01 == "None"] <- 0

pisa.log(y="SKIP", x="LATE", by="IDCNTRYL", data = pisa2)

# from PISA2012lite

student2012$SKIP[(student2012$ST09Q01 == "None " & student2012$ST115Q01 == 1)] <- 1
student2012$SKIP[student2012$ST09Q01 == "None " & student2012$ST115Q01 == 1] <- 0

student2012$LATE[(student2012$ST08Q01 == "None "] <- 1
student2012$LATE[student2012$ST08Q01 == "None "] <- 0

pisa.log(y="SKIP", x="LATE", by="CNT", data = student2012)

## End(Not run)
```
timss.log.pv  

Logistic regression analysis with plausible values

Description

timss.log.pv performs logistic regression with plausible values and replicate weights.

Usage

timss.log.pv(pvlabel="BSMMAT", x, by, cutoff,
data, export=FALSE, name = "output", folder=getwd())

Arguments

pvlabel  The label corresponding to the achievement variable, for example, "BSMMAT". for overall mathematics performance.
x  Data labels of independent variables.
cutoff  The cut-off point at which the dependent plausible values scores are dichotomised (1 is larger than the cut-off)
by  The label for the categorical grouping variable (i.e., by="IDCNTRYL") or variables (e.g., x= c("IDCNTRYL", "ITSEX").
data  An R object, normally a data frame, containing the data from TIMSS.
export  A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name  The name of the exported file.
folder  The folder where the exported file is located.

Value

timss.log.pv returns a data frame with coefficients, standard errors, t-values, and odds ratios. If "by" is specified, results are reported in a list.

See Also

pisa.log.pv, pirls.log.pv

Examples

## Not run:
timss.log.pv(pvlabel="BSMMAT", cutoff= 550, x=c("ITSEX", "BSBGSLM"), by="IDCNTRYL", data=timss8g)
intsvy.log.pv(pvlabel="BSMMAT", cutoff= 550, x="ITSEX", by="IDCNTRYL",
data=timss8g, config=timss8_conf)

## End(Not run)
timss.mean  Calculates mean of variable

Description

Calculates the mean of an observed variable (NOT one with plausible values) and its standard error.

Usage

```
timss.mean(variable, by, data, export = FALSE, name = "output", folder = getwd())
```

Arguments

- `variable` The label corresponding to the observed variable, for example, "ASDAGE", for the age of the student.
- `by` The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- `data` An R object, normally a data frame, containing the data from TIMSS.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
- `folder` The folder where the exported file is located.

Value

timss.mean returns a data frame with means and standard errors.

See Also

pirls.mean, pisa.mean

Examples

```
# Not run:
# TIMSS G4: Exhibit 8.1 International Report TIMSS 2011, p. 330
timss.mean(variable='ASBGSLM', by='IDCNTRYL', data=timss4g)

# TIMSS G8: Exhibit 2.17 User Guide TIMSS 2011, p. 27
timss.mean(variable='BSBGSLM', by='IDCNTRYL', data=timss8g)
```

## End(Not run)
timss.mean.pv  

**Calculates mean achievement score**

**Description**

timss.mean.pv uses five plausible values to calculate the mean achievement score and its standard error.

**Usage**

```r
timss.mean.pv(pvlabel = "BSMMAT", by, data, export = FALSE, name = "output", folder = getwd())
```

**Arguments**

- `pvlabel` The label corresponding to the achievement variable, for example, "BSMMAT". for overall math performance in Grade 8.
- `by` The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
- `data` An R object, normally a data frame, containing the data from TIMSS.
- `export` A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name` The name of the exported file.
- `folder` The folder where the exported file is located.

**Value**

timss.mean.pv returns a data frame with the mean values and standard errors.

**See Also**

pirls.mean.pv, pisa.mean.pv

**Examples**

```r
## Not run:
# TIMSS G4: Exhibit 1.1 International report TIMSS, p. 40
timss.mean.pv(pvlabel="ASMMAT", by= "IDCNTRYL", data=timss4g)

# TIMSS G8: Exhibit 2.8 User Guide TIMSS 2011, p. 18
timss.mean.pv(pvlabel="BSMMAT", by= c("IDCNTRYL", "ITSEX"), data=timss8g)

## End(Not run)
```
timss.per.pv

TIMSS percentiles

Description

Calculates percentiles for plausible values

Usage

`timss.per.pv(pvlabel="BSMMAT", by, per, data, export=FALSE, name= "output", folder=getwd())`

Arguments

- `pvlabel`: The label corresponding to the achievement variable, for example, "BSMMAT", for overall mathematics performance.
- `per`: User-defined percentiles (e.g., `per = c(5, 10, 25, 75, 90, 95)`).
- `by`: The label of the categorical grouping variable (e.g., `by="IDCNTRYL"`) or variables (e.g., `by=c("IDCNTRYL", "ITSEX")`).
- `data`: An R object, normally a data frame, containing the data from TIMSS.
- `export`: A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
- `name`: The name of the exported file.
- `folder`: The folder where the exported file is located.

Value

timss.per.pv returns a data frame with percentiles and associated standard errors. Default weights (e.g. "TOTWGT" in TIMSS) and percentiles are specified in the config parameter.

See Also

pisa.per.pv, pirls.per.pv

Examples

```r
## Not run:
# Appendix G.2, p. 484, TIMSS 2011 International Results in Mathematics
timss.per.pv(pvlabel="BSMMAT", per = c(5, 10, 25, 75, 90, 95), by="IDCNTRYL", data=timssg8)

## End(Not run)
```
timss.reg  Regression analysis

Description

timss.reg performs linear regression analysis (OLS) for an observed dependent variable (NOT for plausible values)

Usage

timss.reg(y, x, by, data,
                    export = FALSE, name = "output", folder = getwd())

Arguments

y  Label for dependent variable.
x  Data labels of independent variables.
by  The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
data  An R object, normally a data frame, containing the data from TIMSS.
export  A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name  The name of the exported file.
folder  The folder where the exported file is located.

Value

timss.reg prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores different regression output including residuals and replicate coefficients in a list object of class "intsvy.reg".

See Also

pirls.reg

Examples

## Not run:
timss.reg(y="BSDAGE", x="ITSEX", by="IDCNTRYL", data=timss8g)

## End(Not run)
timss.reg.pv

Regression analysis with plausible values

Description

timss.reg.pv performs linear regression analysis (OLS) with plausible values and replicate weights.

Usage

timss.reg.pv(x, pvlabel = "BSMMAT", by,
data, std=FALSE, export = FALSE, name = "output", folder = getwd())

Arguments

x          Data labels of independent variables.
pvlabel    The label corresponding to the achievement variable, for example, "BSMMAT", for overall math performance in Grade 8.
by         The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
data       An R object, normally a data frame, containing the data from TIMSS.
std         A logical value. If TRUE standardised regression coefficients are calculated.
export      A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name        The name of the exported file.
folder      The folder where the exported file is located.

Value

timss.reg.pv prints a data.frame with regression results (i.e., coefficients, standard errors, t-values, R-squared) and stores different regression output including residuals, replicate coefficients, variance within and between, and the regression data.frame in a list object of class "intsvy.reg".

See Also

pirls.reg.pv, pisa.reg.pv

Examples

## Not run:
# TIMSS G8: Exhibit 2.11, User Guide TIMSS 2011, p.21
timss8g$SEX[timss8g$ITSEX=="BOY"]=1
timss8g$SEX[timss8g$ITSEX=="GIRL"]=0
timss.reg.pv(pvlabel="BSMMAT", by=c("IDCNTRYL"), x="SEX", data=timss8g)

## End(Not run)
timss.rho  

Correlation matrix

Description

timss.rho produces a correlations matrix for observed variables (NOT for plausible values)

Usage

timss.rho(variables, by, data,
export = FALSE, name = "output", folder = getwd())

Arguments

  variables  Data labels for the variables in the correlation matrix.
  by         The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
  data       An R object, normally a data frame, containing the data from TIMSS.
  export     A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
  name       The name of the exported file.
  folder     The folder where the exported file is located.

Value

timss.rho returns a matrix including correlation and standard error values.

See Also

  pirls.rho, pirls.rho.pv, timss.rho.pv

Examples

  ## Not run:
  timss.rho(variables=c("BSMMAT01", "BSDGEDUP"), data=timss)

  ## End(Not run)
Description

timss.rho.rv calculates the correlation and standard error among two achievement variables each based on 5 plausible values or one achievement variable and an observed variable (i.e., with observed scores rather than plausible values).

Usage

timss.rho.pv(variable, pvlabels, by, data, export = FALSE, name = "output", folder = getwd())

Arguments

variable A data label for the observed variable
pvlabels One or two labels describing the achievement variables.
by The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"), but could be any other categorical variable.
data An R object, normally a data frame, containing the data from TIMSS.
export A logical value. If TRUE, the output is exported to a file in comma-separated value format (.csv) that can be opened from LibreOffice or Excel.
name The name of the exported file.
folder The folder where the exported file is located.

Value

timss.rho.pv returns a matrix with correlations and standard errors.

See Also

pirls.rho.pv, pirls.rho, timss.rho

Examples

## Not run:
timss.rho.pv(variable="BSDGEDUP", pvlabel="BSMMAT", by="IDCNTRYL", data=timss)

## End(Not run)
timss.table

Frequency table

Description

timss.table produces a frequency table for a categorical variable printing percentages and standard errors. Information about weight is extracted from intsvy::pirls_conf.

Usage

timss.table(variable, by, data,
    export = FALSE, name = "output", folder = getwd())

Arguments

  variable    The data label with the variable to be analysed.
  by          The label for the grouping variable, usually the countries (i.e., by="IDCNTRYL"),
              but could be any other categorical variable.
  data        An R object, normally a data frame, containing the data from TIMSS.
  export      A logical value. If TRUE, the output is exported to a file in comma-separated
              value format (.csv) that can be opened from LibreOffice or Excel.
  name        The name of the exported file.
  folder      The folder where the exported file is located.

Value

timss.table returns a data frame with percentages and standard errors.

See Also

pirls.table, pisa.table

Examples

## Not run:

# TIMSS G4: Exhibit 8.1 International Report 2011, p. 330
timss.table(variable="ASDGSLM", by="IDCNTRYL", data=timss4g)

# TIMSS G8: Exhibit 2.19 User Guide TIMSS 2011, p. 29
timss.table(variable="BSDGSLM", by="IDCNTRYL", data=timss8g)

## End(Not run)
timssg4.select.merge Select and merge data

Description

timssg4.select.merge selects and merges data from TIMSS G4. Achievement and weight variables (all of them) are selected by default.

Usage

timssg4.select.merge(folder = getwd(), countries, student = c(), home, school, teacher)

Arguments

folder          Directory path where the data are located. The data could be organized within folders but it should not be duplicated.
countries      The selected countries, supplied with the abbreviation (e.g., countries=c("AUT", "BGR") or codes (countries=c(40, 100)). If no countries are selected, all are selected.
student         The data labels for the selected student variables.
home            The data labels for the selected home background variables.
school          The data labels for the selected school variables.
teacher         The data labels for the selected teacher variables.

Value

timssg4.select.merge returns a data frame with the selected data from TIMSS G4.

See Also

timssg8.select.merge, pirls.select.merge, pisa.select.merge

Examples

## Not run:
timss4g <- timssg4.select.merge(folder=getwd(),
    countries=c("AUS", "BHR", "ARM", "CHL"),
    student =c("ITSEX", "ASDAGE", "ASBGLM", "ASDGSLM"),
    home = c("ASDHEDUP", "ASDHENA"),
    school =c("ACDG03", "ACDGENS")

## End(Not run)
timssg4.var.label  

Data labels

description

timssg4.var.labels prints and saves variable labels and names of participating countries in a text file.

usage

timssg4.var.label(folder = getwd(), name = "Variable labels", output = getwd())

Arguments

folder  Directory path where the TIMSS G4 data are located. The data could be organized within folders but it should not be duplicated.

name  Name of output file.

output  Folder where output file is located.

value

timssg4.var.label returns a list with variable labels for the student, home, school, and teacher data.

see also

timssg8.var.label, pirls.var.label, pisa.var.label

examples

## Not run:
timssg4.var.label(folder = getwd())

## End(Not run)

timssg8.select.merge  

Select and merge data

description

timssg8.select.merge selects and merges data from TIMSS G8.

usage

timssg8.select.merge(folder = getwd(), countries, student = c(), school, math.teacher, science.teacher)
Arguments

folder  Directory path where the data are located. The data could be organized within folders but it should not be duplicated.
countries  The selected countries, supplied with the abbreviation (e.g., countries=c("AUT", "BGR") or codes (countries=c(40, 100)). If no countries are selected, all are selected.
student  The data labels for the selected student variables.
school  The data labels for the selected school variables.
math.teacher  The data labels for the selected math teacher variables.
science.teacher  The data labels for the selected science teacher variables.

Value
timssg8.select.merge returns a data frame with the selected data from TIMSS G8.

See Also
timssg4.select.merge, pirls.select.merge, pisa.select.merge

Examples

## Not run:
timssg8 <- timssg8.select.merge(folder=getwd(),
countries=c("AUS", "BHR", "ARM", "CHL"),
student =c("BSDGEDUP", "ITSEX", "BSDAGE", "BSDGSLM", "BSDGSLM"),
school =c("BCBGOAS", "BCD803"))

## End(Not run)

timssg8.var.label  Data labels

Description
timssg8.var.labels prints and saves variable labels and names of participating countries in a text file

Usage
timssg8.var.label(folder = getwd(), name = "Variable labels", output = getwd())

Arguments

folder  Directory path where the TIMSS G8 data are located. The data could be organized within folders but it should not be duplicated.
name  Name of output file.
output  Folder where output file is located.
**Value**

`timssg8.var.label` returns a list with variable labels for the student, home, school, and teacher data.

**See Also**

`timssg4.var.label`, `pirls.var.label`, `pisa.var.label`

**Examples**

```r
## Not run:
timssg8.var.label(folder = getwd())

## End(Not run)
```
