Package ‘pkgmaker’

May 26, 2018

Type Package

Title Development Utilities for R Packages

Version 0.27

Date 2018-05-25

Description Provides some low-level utilities to use for package development. It currently provides managers for multiple package specific options and registries, vignette, unit test and bibtex related utilities. It serves as a base package for packages like NMF, RcppOctave, doRNG, and as an incubator package for other general purposes utilities, that will eventually be packaged separately. It is still under heavy development and changes in the interface(s) are more than likely to happen.

License GPL (>= 2)

URL https://renozao.github.io/pkgmaker

BugReports http://github.com/renozao/pkgmaker/issues

LazyLoad yes

Encoding UTF-8

Depends R (>= 3.0.0), methods, stats, registry

Imports tools, grDevices, utils, graphics, codetools, digest, stringi, magrittr, stringr, xtable, withr, bibtex (>= 0.4)

Suggests devtools (>= 0.8), roxygen2, RUnit, testthat, knitr, rmarkdown, yaml, Biobase

Collate 'bibtex.R' 'colors.R' 'data.R' 'namespace.R' 'utils.R'

Description

Generates a wrapper function that silences the output, messages, and/or warnings of a given function.

Usage

NsilenceF(f, level = 7L)

Arguments

f function to silence
level a single numeric (integer) that indicates the silencing level, which encode the set of output to be silenced.

It is interpreted like unix permission bit system, where each bit of the binary expression of the silencing level corresponds to a given type of output:

- 0: nothing silenced;
- 1: stderr;
- 2: stderr messages;
- 4: stderr warnings.

For example, level 3 \( = 2 + 1 \) means silencing stdout and stderr, while 5 \( = 3 + 2 \) means silencing stderr messages and warnings, but not outputs to stdout. The default value is 7 \( = 4 + 2 + 1 \), which silences all output.

Negative values are supported and mean "silence everything except the corresponding type", e.g., level \( = -1 \) silences all except stdout (computed as the binary complementary of 7, i.e. 7 \( - 1 = 5 = 3 + 2 \)). See examples.

Value

a function

Examples

```r
f <- function(){
cat("stdout message\n")
message("stderr message")
warning("stderr warning", immediate. = TRUE)
}
```
# example of generated wrapper

g <- .silenceF(f)
g

# use of silencing level
for(l in 7:7){ message("\nLevel: ", 1); .silenceF(f, 1L) }

# inline functions
ifun <- .silenceF(function() { f(); invisible(1) })
ifun()
ifun <- .silenceF(function() { f(); 1 })
ifun()
ifun <- .silenceF(function() { f(); 1 }, 2L)
ifun()

---

### addnames

#### Generating Names

**Description**

Generates names or dimnames for objects.

**Usage**

```r
addnames(x, ...)  
```

#### Default S3 method:

```r
addnames(x, ...)  
```

#### S3 method for class 'vector'

```r
addnames(x, prefix = "x", sep = "", ...)  
```

#### S3 method for class 'array'

```r
addnames(x, prefix = letters[1:length(dim(x))], sep = "", ...)  
```

#### S3 method for class 'matrix'

```r
addnames(x, prefix = c("row", "col"), ...)  
```

**Arguments**

- `x` object whose names are generated.
- `...` extra arguments to allow extension and passed to the next method.
- `prefix` prefix string to use. A vector can be used to specify a prefix for each dimension of `x`. Names are built as `<prefix><sep><index>`.
- `sep` separator used between the prefix and the numeric index.
**addToLogger**  
*Enhancing RUnit Logger*

**Description**

Adds a function or a local variable to RUnit global logger.

**Usage**

```
addToLogger(name, value, logger = NULL)
```

**Arguments**

- **name**
  
  name of the function or variable to add

- **value**
  
  object to append to the logger. If `value` is a function it is added to the list and is accessible via `testLogger$\text{name}`. If `value` is a variable it is added to the local environment and is therefore accessible in all logging functions.

- **logger**
  
  an optional RUnit logger object. If missing or NULL, the object `testLogger` is searched in `.GlobalEnv` and an error is thrown if it does not exist.

**Value**

the modified logger object. Note that the global object is also modified if `logger` is NULL.

---

**add_lib**  
*Adding Package Libraries*

**Description**

Prepend/append paths to the library path list, using `.libPaths`.

**Usage**

```
add_lib(..., append = FALSE)
```

**Arguments**

- **...**
  
  paths to add to `.libPath`

- **append**
  
  logical that indicates that the paths should be appended rather than prepended.
Details

This function is meant to be more convenient than .libPaths, which requires more writing if one wants to:

- sequentially add libraries;
- append and not prepend new path(s);
- keep the standard user library in the search path.

Examples

```r
ol <- .libPaths()
# called sequentially, .libPaths only add the last library
show( .libPaths(´.´) )
show( .libPaths(tempdir()) )
# restore
.libPaths(ol)

# .libPaths does not keep the standard user library
show( .libPaths() )
show( .libPaths(´.´) )
# restore
.libPaths(ol)

# with add_lib
show( add_lib(´.´) )
show( add_lib(tempdir()) )
show( add_lib(´..´, append=TRUE) )

# restore
.libPaths(ol)
```

alphacol

Colour utilities

Description

alphacol adds an alpha value to a colour specification and convert to a hexadecimal colour string.

Usage

```r
alphacol(col, alpha = FALSE)
```
Arguments

`col` vector of any of the three kinds of \( \mathbb{R} \) color specifications, i.e., either a color name (as listed by `colors()`), a hexadecimal string of the form "#rrggbb" or "#rrggbbbaa" (see `rgb`), or a positive integer \( i \) meaning `palette() [i]`.

`alpha` logical value indicating whether the alpha channel (opacity) values should be returned.

Examples

```r
# Alphas
alphacol('red')  # do nothing
alphacol('red', 10)
alphacol('#aabbcc', 5)
alphacol(4, 5)
```

`askUser` *User Queries*

Description

This function is an improved version of `userQuery` from Bioconductor `Biobase` package, which asks the user about some task that needs her intervention to proceed, e.g., ask if one should perform a computation, install a package, etc..

Usage

```r
askUser(msg, allowed = c("y", "n"), idefault = "n", default = "n",
case.sensitive = FALSE)
```

Arguments

`msg` The output message

`allowed` Allowed input from the user

`idefault` default response in interactive mode. This answer will be in upper case in the question and will be the one returned if the user simply hits return.

`default` default response in non-interactive mode.

If NA, then the user is forced to provide an answer, even in non-interactive mode (e.g., when run through `Rscript`).

`case.sensitive` Is the response case sensitive? Defaults to FALSE

Value

the character string typed/agreed by the user or directly the default answer in non-interactive mode.
Description

Utility functions to work with BiBTeX files.

Usage

```r
packageReferenceFile(PACKAGE = NULL, check = FALSE)
package_bibliography(PACKAGE = NULL, action = c("path", "copy", "load"))
```

Arguments

- `PACKAGE`: package name. If `NULL`, then the name of the calling package is used.
- `check`: logical that indicates if the result should be an empty string if the bibliography file (or package) does not exist.
- `action`: single character string that specifies the action to be performed:
  - 'path': return the path to the bibliography file. It returns an empty character string if the file does not exist.
  - 'copy': copy the bibliography file to the current directory, overwriting any existing REFERENCES.bib file.
  - 'load': load the bibliography file and return a list of `utils::bibentry` objects. It returns `NULL` if the file does not exist.

Functions

- `packageReferenceFile`: returns the path to a package REFERENCES.bib file.
- `package_bibliography`: returns the bibliography associated with a package. This can

Examples

```r
packageReferenceFile('pkgmaker')
packageReferenceFile('pkgmaker', check = TRUE)
```
**cgetAnywhere**  
*Get Anywhere*

**Description**

Similar to `getAnywhere`, but looks for the value of its argument.

**Usage**

`cgetAnywhere(x)`

**Arguments**

- `x` a single character string

---

**charmap**  
*Substituting Strings Against a Mapping Table*

**Description**

Match the elements of a character vectors against a mapping table, that can specify multiple exact or partial matches.

**Usage**

`charmap(x, maps, nomatch = NULL, partial = FALSE, rev = FALSE)`

**Arguments**

- `x` character vector to match
- `maps` mapping tables. May be a character vector, a list of character vectors or a function.
- `nomatch` character string to be used for non-matched elements of `x`. If NULL, these elements are left unchanged.
- `partial` logical that indicates if partial matches are allowed, in which case mappings are used as regular expressions.
- `rev` logical that indicates if the mapping should be interpreted in the reverse way.
checkWarning

Description

checkWarning checks if a warning is generated by an expression, and optionally follows an expected regular expression pattern.

Usage

checkWarning(expr, expected = TRUE, msg = NULL)

Arguments

expr an R expression
expected expected value as regular expression pattern. If a logical, then it specifies if a warning is expected or not.
For backward compatibility, a NULL value is equivalent to TRUE.
msg informative message to add to the error in case of failure

Examples

# check warnings
checkWarning({ warning('ah ah'); 3})
checkWarning({ warning('ah oh ah'); 3}, 'oh')
try( checkWarning(3) )
try( checkWarning({ warning('ah ah'); 3}, 'warn you') )

citecmd

Description

Create a citation command from package specific BibTex entries, suitable to be used in Rd files or Latex documents. The entries are looked in a file named REFERENCES.bib in the package’s root directory (i.e. inst/ in development mode).

Usage

citecmd(key, ..., REFERENCES = NULL)
Arguments

key  character vector of BibTex keys
    ...
REFERENCES  package or bibentry specification

Value

a character string containing the text formatted BibTex entries

---

compile_src  Compile Source Files from a Development Package

Description

Compile Source Files from a Development Package

Usage

compile_src(pkg = NULL, load = TRUE)

Arguments

pkg  the name of the package to compile
load  a logical indicating whether the compiled library should be loaded after the compilation (default) or not.

Value

None

---

CRAN  Main CRAN Mirror URL

Description

CRAN simply contains the url of CRAN main mirror (https://cran.r-project.org), and aims at simplifying its use, e.g., in calls to install.packages.

Usage

CRAN

Format

An object of class character of length 1.
Examples

```r
## Not run:
install.packages('pkgmaker', repos=CRAN)

## End(Not run)
```

---

### Description

`exitCheck` provides a mechanism to distinguish the exit status in `on.exit` expressions.

### Usage

```r
exitCheck()
```

### Details

It generates a function that is used within a function’s body to "flag" normal exits and in its `on.exit` expression to check the exit status of a function. Note that it will correctly detect errors only if all normal exit are wrapped into a call to it.

### Examples

```r
# define some function
f <- function(err){
  # initialise an error checker
  success <- exitCheck()

  # do something on exit that depends on the error status
  on.exit({
    if(success()) cat("Exit with no error: do nothing\n")
    else cat("Exit with error: cleaning up the mess ...\n")
  })

  # throw an error here
  if( err ) stop('There is an error')

  success(1+1)
}

# without error
```
expand_list

**Description**

expand_list expands a named list with a given set of default items, if these are not already in the list, partially matching their names.

**Usage**

`expand_list(x, ..., .exact = TRUE, .names = !.exact)`

`expand_dots(..., .exclude = NULL)`

**Arguments**

- `x`: input list
- `...`: extra named arguments defining the default items. A list of default values can also be passed as a single unnamed argument.
- `.exact`: logical that indicates if the names in `x` should be partially matched against the defaults.
- `.names`: logical that only used when `.exact=FALSE` and indicates that the names of items in `x` that partially match some defaults should be expanded in the returned list.
- `.exclude`: optional character vector of argument names to exclude from expansion.

**Value**

a list

**Functions**

- `expand_dots`: expands the `...` arguments of the function in which it is called with default values, using `expand_list`. It can only be called from inside a function.

**Examples**

```r
expand_list(list(a=1, b=2), c=3)
expand_list(list(a=1, b=2, c=4), c=3)
# with a list
```
Exposing Object Attributes

Description

The function `ExposeAttribute` creates an S3 object that exposes all attributes of any R object, by making them accessible via methods `$` and/or `@`

Usage

```r
ExposeAttribute(object, ..., .MODE = "rw", .VALUE = FALSE)
attr_mode(x)
attr_mode(x) <- value
```
extractLocalFun

Arguments

object any R object whose attributes need to be exposed

... attributes, and optionally their respective values or access permissions. See argument value of attr_mode for details on the way of specifying these.

.MODE access mode:

“r”: (read-only) only method $ is defined

“w”: (write-only) only method $<- is defined

“rw”: (read-write) both methods $ and $<- are defined

.VALUE logical that indicates if the values of named arguments in ... should be considered as attribute assignments, i.e. that the result object has these attributes set with the specified values. In this case all these attributes will have the access permission as defined by argument .MODE.

x an ExposeAttribute object

value replacement value for mode. It can be NULL to remove the ExposeAttribute wrapper, a single character string to define a permission for all attributes (e.g., ‘rw’ or ‘r’), or a list specifying access permission for specific attributes or classes of attributes defined by regular expressions. For example, list(a='r', b='w', 'blabla.*=' 'rw') set attribute ‘a’ as read-only, attribute ‘b’ as write-only, all attributes that start with ‘blabla’ in read-write access.

extractLocalFun Extracting Local Function Definition

Description

extractLocalFun Extracts local function from wrapper functions of the following type, typically used in S4 methods: ‘ function(a, b, ...){ .local <- function(a, b, c, d, ...){} .local(a, b, ...) } ’

Works for methods that are created (setMethod) as a wrapper function to an internal function named .local.

Usage

extractLocalFun(f)

allFormals(f)

Arguments

f definition of the wrapper function

Value

extractLocalFun: a function

allFormals: a paired list like the one returned by formals.
factor2character

Converting Factors to Character Vectors

Description
Converting Factors to Character Vectors

Usage
factor2character(x)

Arguments
x data.frame or ExpressionSet object

Value
an object of the same class as x.

file_extension

Extract File Extension

Description
Extract File Extension

Usage
file_extension(x, ext = NULL)

Arguments
x path as a character vector.

ext extension to append instead of the original extension.

Examples

```r
file_extension('alpha.txt')
file_extension(paste('aa.tt', 1:5, sep=''))
# change extension
file_extension(paste('aa.tt', 1:5, sep=''), 'pdf')
file_extension(paste('aatt', 1:5, sep=''), 'pdf')
```
find_devpackage  

Find Path to Development Package Root Directory

Description

Development packages are looked-up according to rules defined in a file `.Rpackages` in the user’s home directory.

Usage

```
find_devpackage(x, error = TRUE)
```

Arguments

- `x` name of the development package to lookup.
- `error` logical that indicates if an error is thrown when the project root directory could not be found.

Specification of package path

Package paths are specified in a list with:

- unnamed elements: character strings give path to directories to lookup for sub-directories that match exactly the package’s name;
- named element containing character strings: these are paths that are looked up only for packages that match the element name. If the element name contains any of the characters `*?()$`\`\[`, then it is matched using regular expression.

getLoadingNamespace  

Namespace Development Functions

Description

getLoadingNamespace returns information about the loading namespace. It is a wrapper to `loadingNamespaceInfo`, that does not throw an error.

Usage

```
getLoadingNamespace(env = FALSE, info = FALSE, nodev = FALSE)

isLoadingNamespace(ns, nodev = FALSE)

isNamespaceLoaded2(ns)

isDevNamespace(ns)
```
addNamespaceExport(x)

ns_get(x, ns = NULL, ...)

Arguments

env logical that indicates that the namespace’s environment (i.e. the namespace itself) should be returned.
info logical that indicates that the complete information list should be returned
nodev logical that indicates if loading devtools namespace should be discarded.
ns the name of a namespace or a namespace whose loading state is tested. If missing isLoadingNamespace test if any namespace is being loaded.
x character vector containing the names of R objects to export in the loading namespace.
... extra arguments passed to get0.

Value

gloadingNamespace: the name of the loading namespace if env and info are FALSE, an environment if env=TRUE, a list with elements pkgname and libname if info=TRUE.

Functions

• isLoadingNamespace: Tests if a namespace is being loaded.
• isNamespaceLoaded2: tests if a given namespace is loaded, without loading it, contrary to isNamespace. It is similar to isNamespaceLoaded – which it uses – but also accepts environments.
• isDevNamespace: tests the – current – namespace is a devtools namespace.
• addNamespaceExport: Dynamically adds exported objects into the loading namespace.
• ns_get: gets an object from a given namespace.

---

gfile Open a File Graphic Device

Description

Opens a graphic device depending on the file extension.

Usage

gfile(filename, width, height, ...)
Arguments

filename  path to the image file to create.
width  output width
height  output height
...  other arguments passed to the relevant device function such as `png` or `pdf`.

importFrom grDevices bmp jpeg pdf png svg tiff

---

**Description**

Utility Functions for Graphics

mfrow returns a 2-long numeric vector suitable to use in `par(mfrow=x)`, that will arrange n panels in a single plot.

**Usage**

mfrow(n)

**Arguments**

n  number of plots to be arranged.

**Examples**

mfrow(1)
mfrow(2)
mfrow(3)
mfrow(4)
mfrow(10)
hasArg2

Checking for Missing Arguments

Description

This function is identical to hasArg, except that it accepts the argument name as a character string. This avoids to have a check NOTE about invisible binding variable.

Usage

hasArg2(name)

Arguments

name the name of an argument as a character string.

Examples

f <- function(...) { hasArg2('abc') }
f(a=1)
f(abc=1)
f(b=1)

hasEnvar

Check Environment Variables

Description

Tells if some environment variable(s) are defined.

Usage

hasEnvar(x)

Arguments

x environment variable name, as a character vector.
Examples

```r
hasEnvar('_R_CHECK_TIMINGS_')
hasEnvar('ABCD')
```

---

**inSweave**  
**Identifying Sweave Run**

**Description**

Tells if the current code is being executed within a Sweave document.

**Usage**

```r
inSweave()
```

**Value**

TRUE or FALSE

**Examples**

```
# Not in a Sweave document
inSweave()

# Within a Sweave document
```

---

**irequire**  
**Require a Package with User Interaction**

**Description**

Like base `require`, `irequire` tries to find and load a package, but in an interactive way, i.e. offering the user to install it if not found.

**Usage**

```r
irequire(package, lib = NULL, ..., load = TRUE, msg = NULL, quiet = TRUE, prependLF = FALSE, ptype = c("CRAN-like", "BioC", "BioCsoft", "BioCann"), autoinstall = !interactive())
```
isCRANcheck

Arguments

- **package**: name of the package
- **lib**: path to the directory (library) where the package is to be looked for and installed if agreed by the user.
- **...**: extra arguments passed to `install.packages`
- **load**: a logical that indicates if the package should be loaded, possibly after installation.
- **msg**: message to display in case the package is not found when first trying to load/find it. This message is appended to the string “Package '<packagename>' is required”.
- **quiet**: logical that indicates if loading a package should be done quietly with `require.quiet` or normally with `require`.
- **prependLF**: logical that indicates if the message should start at a new line.
- **ptype**: type of package: from CRAN-like repositories, Bioconductor, Bioconductor software, Bioconductor annotation. Bioconductor packages are installed using `bioclite` from the `BiocInstaller` package or fetched on line at `http://bioconductor.org/biocLite.R`.
- **autoinstall**: logical that indicates if missing packages should just be installed without asking with the user, which is the default in non-interactive sessions.

Value

TRUE if the package was successfully loaded/found (installed), FALSE otherwise.

See Also

Other require: `require.quiet`

---

isCRANcheck Package Check Utils

Description

isCRANcheck **tries** to identify if one is running CRAN-like checks.

Usage

- **isCRANcheck(...)**
- **isCRAN_timing()**
- **isCHECK()**
Arguments

... each argument specifies a set of tests to do using an AND operator. The final result tests if any of the test set is true. Possible values are:

'timing' Check if the environment variable _R_CHECK_TIMINGS_ is set, as with the flag '--timing' was set.
'cran' Check if the environment variable _R_CHECK_CRAN_INCOMING_ is set, as with the flag '--as-cran' was set.

Details

Currently isCRANcheck returns TRUE if the check is run with either environment variable _R_CHECK_TIMINGS_ (as set by flag '--timings') or _R_CHECK_CRAN_INCOMING_ (as set by flag '--as-cran').

Warning: the checks performed on CRAN check machines are on purpose not always run with such flags, so that users cannot effectively "trick" the checks. As a result, there is no guarantee this function effectively identifies such checks. If really needed for honest reasons, CRAN recommends users rely on custom dedicated environment variables to enable specific tests or examples.

Functions

• isCRAN_timing: tells if one is running CRAN check with flag '--timing'.
• isCHECK: tries harder to test if running under R CMD check. It will definitely identifies check runs for:
  – unit tests that use the unified unit test framework defined by pkgmaker (see utest);
  – examples that are run with option R_CHECK_RUNNING_EXAMPLES_ = TRUE, which is automatically set for man pages generated with a fork of roxygen2 (see References).

Currently, isCHECK checks both CRAN expected flags, the value of environment variable _R_CHECK_RUNNING_UTESTS_ and the value of option R_CHECK_RUNNING_EXAMPLES_. It will return TRUE if any of these environment variables is set to anything not equivalent to FALSE, or if the option is TRUE. For example, the function utest sets it to the name of the package being checked (_R_CHECK_RUNNING_UTESTS_=<pkgname>), but unit tests run as part of unit tests vignettes are run with _R_CHECK_RUNNING_UTESTS_=FALSE, so that all tests are run and reported when generating them.

References

Adapted from the function CRAN in the fda package.

https://github.com/renozao/roxygen

Examples

isCHECK()
is_package_path  

Test for Package Root Directory

**Description**

Tells if a directory is a package directory, i.e. that it contains a DESCRIPTION file.

**Usage**

is_package_path(x, error = FALSE)

**Arguments**

- `x`: path to the directory to test
- `error`: logical that indicates if an error should be raised if the directory is not a package directory.

---

is_something  

Testing Object Type

**Description**

Testing Object Type

is NA tests if a variable is exactly NA (logical, character, numeric or integer)

is FALSE Tests if a variable is exactly FALSE.

is Number tests if a variable is a single number

is Real tests if a variable is a single real number

is Integer tests if an object is a single integer

is String tests if an object is a character string.

is dir tests if a filename is a directory.

is file tests if a filename is a file.

has Names tests if an object has names.

**Usage**

is NA(x)

is FALSE(x)

is Number(x)

is Real(x)
isInteger(x)
isString(x, y, ignore.case = FALSE)
is.dir(x)
is.file(x)
hasNames(x, all = FALSE)

Arguments

x an R object
y character string to compare with.
ignore.case logical that indicates if the comparison should be case sensitive.
all logical that indicates if the object needs all names non empty

Value

TRUE or FALSE

See Also

isTRUE

iterCount Simple Text Iteration Counter

Description

Simple Text Iteration Counter

Usage

iterCount(n = 100, i0 = 0L, title = "Iterations", extra = NULL, verbose = TRUE)

Arguments

n number of total steps
i0 starting step
title character string to use as title
extra character vector providing extra text to add at each step
verbose logical that toggles the counter
**Examples**

```r
progress <- iterCount(LETTERS)
res <- sapply(LETTERS, function(x){
  Sys.sleep(.1)
  progress()
})
# terminate counter
i_end <- progress(NULL)
i_end
```

**Description**

`knit_ex` is a utility function for running small knitr examples, e.g., to illustrate functionalities or issues.

`hook_backspace` is a chunk hook that enables the use of backspace characters in the output (e.g., as used in progress bars), and still obtain a final output as in the console.

**Usage**

```r
knit_ex(x, ..., quiet = TRUE, open = FALSE)

hook_try(before, options, envir)

hook_backspace()

hook_toggle()
```

**Arguments**

- `x`: text to knit as a character vector
- `...`: arguments passed to `knit2html` or `knit`
- `quiet`: logical that indicates if knitting should be quiet (no progress bars etc.).
- `open`: logical, only used when `x` is in .Rmd format, that indicates if the generated document result should be open in a browse, instead of being printed on screen. Not that a browser will not open in non-interactive sessions, and the result will be returned invisibly.
- `before`: logical that indicates when the hook is being called: before or after the chunk is processed.
- `options`: list of current knitr chunk options
- `envir`: environment where the chunk is evaluated
knit_ex returns the generated code, although invisibly when open=TRUE.

Functions

- **hook_try**: is a knitr hook to enable showing error messages thrown by `try`. The function is not meant to be called directly, but only registered using `knitr::knit_hooks` (see details on this dedicated man page).
  This simply defines a function `try` in `envir` that prints the error message if any, and is called instead of base `try`.
- **hook_toggle**: is a chunk hook that adds clickable elements to toggle *individual* code chunks in HTML documents generated from .Rmd files.

Examples

```r
library(knitr)
kinit_ex("1 + 1")

library(knitr)

# standard error message is caught
kinit_ex("stop('ah ah')")

# with try the error is output on stderr but not caughted by knitr
kinit_ex("try( stop('ah ah') )")

# no message caught
kinit_ex(""

```r
**[^^r, include = FALSE]**

```
knit_hooks$set(try = pkgmaker::hook_try)
```

```r
**[^^r, try=TRUE]**

```r
try( stop('ah ah') )
```

```
```

# Correctly formatting backspaces in chunk outputs
tmp <- tempfile(fileext = '.Rmd')
cat(file = tmp, "

```r
**[^^r, include = FALSE]**

```
library(knitr)
kinit_ex(""

```r
knit_hooks$set(backspace = pkgmaker::hook_backspace())
```

```
```

Default knitr does not handle backspace and adds a special character:

```r
```
```r
```r
```
```

Using the hook backspace solves the issue:
```{rL backspace
  true}

```

# knit
out <- knitr::knit2html(tmp, fragment.only = TRUE)
# look at output
## Not run:
  browseURL(out)
  edit( file = out)

## End(Not run)
# cleanup
unlink(c(tmp, out))

```

knit_ex(""

Declare chunk hook:
```{rL setup
  }

library(knitr)
knit_hooks$set(toggle = hook_toggle())
```

The R code of this chunk can be toggled on/off, and starts visible:
```{rL toggle
  true}

print(1:10)
```

The R code of this chunk can be toggled on/off, and starts hidden:
```{rL toggle
  false}

print(1:10)
```

This is a plain chunk that cannot be toggled on/off:
```{r
  }

print(1:10)
```

Now all chunks can be toggled and start visible:
```{rL toggle_all
  }

opts_chunk$set(toggle = TRUE)
```

```

To disable the toggle link, one can pass anything except TRUE/FALSE:
latex_preamble

```
```n
\textbackslash^{\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbackslash^\textbacklash

Description

latex_preamble outputs/returns command definition LaTeX commands to be put in the preamble of vignettes.

Usage

latex_preamble(PACKAGE, R = TRUE, CRAN = TRUE, Bioconductor = TRUE, GEO = TRUE, ArrayExpress = TRUE, biblatex = FALSE, only = FALSE, file = "")

Arguments

- PACKAGE: package name
- R: logical that indicate if general R commands should be added (e.g. package names, inline R code format commands)
- CRAN: logical that indicate if general CRAN commands should be added (e.g. CRAN package citations)
- Bioconductor: logical that indicate if general Bioconductor commands should be added (e.g. Bioc package citations)
- GEO: logical that indicate if general GEOmnibus commands should be added (e.g. urls to GEO datasets)
- ArrayExpress: logical that indicate if general ArrayExpress commands should be added (e.g. urls to ArrayExpress datasets)
- biblatex: logical that indicates if a \bibliography command should be added to include references from the package’s REFERENCES.bib file.
- only: a logical that indicates if the only the commands whose dedicated argument is not missing should be considered.
- file: connection where to print. If NULL the result is returned silently.

Details

Argument PACKAGE is not required for latex_preamble, but must be correctly specified to ensure biblatex=TRUE generates the correct bibliography command.
Functions

- \texttt{latex\_bibliography}: \texttt{latex\_bibliography} prints or returns a \LaTeX{} command that includes a package bibliography file if it exists.

Examples

\begin{verbatim}
latex_preamble()
l
latex_preamble(R=TRUE, only=TRUE)
l
latex_preamble(R=FALSE, CRAN=FALSE, GEO=FALSE)
l
latex_preamble(GEO=TRUE, only=TRUE)
\end{verbatim}

---

\textbf{list.libs} \hspace{1cm} \textit{Library Files Utilities}

Description

Lists binary library files in a directory

Usage

\begin{verbatim}
list.libs(dir, ..., all.platforms = FALSE)

libname(x)
\end{verbatim}

Arguments

- \texttt{dir} \hspace{1cm} directory
- \texttt{...} \hspace{1cm} extra arguments passed to \texttt{list.files}.
- \texttt{all.platforms} \hspace{1cm} a logical that indicates whether to list library files for the current platform only (default) or all platforms (Unix, Windows, Mac).
- \texttt{x} \hspace{1cm} a filename

Value

\texttt{list.libs}: a character vector

Functions

- \texttt{libname}: extracts library names from a path, removing the directory part of the path, as well as the platform specific library extension.
Examples

```r
libname('mylib.so')
libname('/some/path/somewhere/mylib.dll')
```

load_project | Load Development Package

Description

Load Development Package

Usage

```r
load_project(pkg, reset = FALSE, ..., utests = TRUE, verbose = FALSE,
             addlib = TRUE, character.only = FALSE, try.library = FALSE)
```

library_project(...)

Arguments

- `pkg` name of the package/project to load.
- `reset` logical that indicates if the package should be reloaded (passed to `load_all`).
- `...` other arguments passed to `load_all`.
- `utests` logical that indicates if an environment containing the unit test functions should be created. If TRUE this environment is accessible at `pkgname::UnitTests$test.filename.r$function`.
- `verbose` logical that indicates if log messages should be printed.
- `addlib` logical that indicates if the `lib/` sub-directory, if it exists, should be prepended to the library path. This enables to control the version of the loaded dependencies.
- `character.only` logical that indicates if argument `pkg` should be evaluated or taken literal.
- `try.library` logical that indicates if projects that could not be found should be looked up in the installed packages.

Functions

- `library_project`: shortcut for `load_project(..., try.library = TRUE)`, to load project code from installed library if not found as a development project. All its arguments are passed to `load_project`. 
Description

`lverbose` returns/sets the current verbosity level.

Usage

```c
lverbose(val, global = FALSE)
lsilent()
is.verbose()
lmessage(level, ..., appendLF = TRUE, sep = "", force = FALSE)
vmessage(...)
log_append(...)
```

Arguments

- `val` logical/numeric value that sets the verbosity level.
- `global` logical that indicates if the verbose level of all log handlers should be set to `val`.
- `level` verbosity level threshold (numeric value) above which the message should be printed out. This threshold is compared with the current verbosity level as returned by `lverbose`.
- `...` parts of a character message that are concatenated and passed to the current logger's write function.
- `appendLF` logical indicating if an endline character should be appended at the end of the message.
- `sep` separation character, used when concatenating all arguments in `...`.
- `force` logical that indicates if one should output messages or return a non null logger, even if the verbose mode is not high enough.

Value

`lverbose`: the old verbose level

Functions

- `lsilent`: tells if all verbose messages are silenced.
- `is.verbose`: tells if verbosity is on, i.e. at level greater than 0.
- `lmessage`: prints out a message (on stdout) if the verbosity level is greater than a given value.
• `vmessage`: prints out a log message (at level 1) using the current logger, typically on stdout. It is a shortcut for `lmessage(1L, ...)`.
• `log_APPEND`: directly appends some message to the current log line.

---

### `makeFakeVignette`  
*Generate a Fake Vignette*

**Description**  
Generate a Fake Vignette

**Usage**  
```
makeFakeVignette(src, out, PACKAGE = NULL)
```

**Arguments**  
- `src` original Sweave file  
- `out` output file  
- `PACKAGE` package name where to look the source vignette

---

### `makeUnitVignette`  
*Make Vignette for Unit Tests*

**Description**  
Builds a vignette for unit tests in a package using the `utest` and a template vignette file.

**Usage**  
```
makeUnitVignette(pkg, file = paste(pkg, "-unitTests.pdf", sep = ""), ..., check = FALSE)
```

**Arguments**  
- `pkg` Package name  
- `file` Output file (.Rnw, .tex, or .pdf)  
- `...` extra arguments passed to `utest`.  
- `check` logical that indicates the call was made from `R CMD check`, in which case the vignette is updated only if results of unit tests can be found in the unit test output directory, where they would have been generated by `utest`.

**Value**  
Result of running unit test suite
make_vignette_auxfiles

*Generate RMarkdown Vignette Auxiliary Files*

**Description**

Generate RMarkdown Vignette Auxiliary Files

**Usage**

```r
make_vignette_auxfiles(PACKAGE, input = NULL, bibfile = "library.bib",
  Rpkg.prefix = "Rpackage_", ...)
```

**Arguments**

- `PACKAGE`: package name
- `input`: vignette source file. If `NULL` then the current file is obtained via a call to `knitr::current_input`.
- `bibfile`: output file for R package citations.
- `Rpkg.prefix`: prefix to use when generating the bibtex entries of cited R packages. If `Rpkg.prefix = 'Rpackage_'`, then Rmarkdown citations should be `@Rpackage_mypkg`.
- `...`: other arguments passed to `latex_preamble`

**Details**

To use this feature add the following in your YAML header:

```yaml
header-includes:
  - \input{"r pkgmaker::make_vignette_auxfiles('pkgmaker')"}
bibliography: library.bib
```

**messagef**

*General Log Formatting*

**Description**

Generate a formatted diagnostic message. This function is a shortcut for `message(sprintf(...))`.

**Usage**

```r
messagef(fmt, ..., domain = NULL, appendLF = TRUE)

wnote(..., immediate. = TRUE)
```
**Arguments**

- **fmt**
  - A character vector of format strings, each of up to 8192 bytes.
  - Values to be passed into `fmt`. Only logical, integer, real and character vectors are supported, but some coercion will be done: see the ‘Details’ section. Up to 100.

- **domain**
  - See `gettext`.

- **appendLF**
  - Logical: should messages given as a character string have a newline appended?

- **immediate**
  - Logical, indicating if the call should be output immediately, even if `getOption("warn") <= 0`.

**Functions**

- `wnote`: throws a simple note as an immediate warning. It is a shortcut for `warning(...)`, `immediate = TRUE`, `call = TRUE`.

**See Also**

`sprintf`, `message`

**Examples**

```r
messagef("Hello %s number %i", 'world', 4)
```

---

**Description**

`mkoptions` is a function that returns a function that behaves like `options`, with an attached internal/local list of key-value pairs.

**Usage**

```r
mkoptions(...)
```

```r
.options(..., .DATA)
```

**Arguments**

- `...`
  - List of keys or key-value pairs. For `mkoptions` these define initial/default key-value pairs.

- `DATA`
  - A list or an environment with an element `.options`. 
Functions

- `options`: is a low-level function that mimics the behaviour of the base function `options`, given a set of key-value pairs. It is the workhorse function used in `mkoptions` and package-specific option sets (see `setupPackageOptions`).

See Also

`setupPackageOptions`

Examples

```r
f <- mkoptions(a=3, b=list(1,2,3))
str(f())
f('a')
f('b')
str(old <- f(a = 10))
str(f())
f(old)
str(f())
```

---

new2  

**Alternative S4 Constructor**

Description

An alternative version of `new` to create objects based on a list of values.

Usage

`new2(class, ...)`

Arguments

- `class`: Class name to instanciate
- `...`: extra arguments from which slot values are extracted by exact matching of names.

Examples

```r
setClass('A', contain='character', representation(x='numeric', y='character'))

# identical behaviour with standard calls
identical(new('A'), new2('A'))
```
oneoffVariable

**One-off Global Variables**

**Description**

Defines a function that allow to get/assign a global variable whose value is ensured to be reset after each access.

**Usage**

oneoffVariable(default = NULL)

**Arguments**

default default value to which the global variable is reset after each access. Default is NULL.

**Value**

a function with one argument (value) that provides get/set access to a global variable. If called with a value, it assigns this value to the global variable. If called with no argument, it returns the current value of the global variable and reset it to its default value – as defined at its creation.

**Examples**

```r
x <- oneoffVariable(0)
# returns default value
x()
# assign a value
x(3)
```
onLoad

# get the value
x()

# second call returns default value again
x()

onLoad

Default Load/Unload Functions

Description
Default Load/Unload Functions

Usage

onLoad(libname = NULL, pkgname, chname = packageName())
onUnload(libpath)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>libname</td>
<td>a character string giving the library directory where the package defining the namespace was found.</td>
</tr>
<tr>
<td>pkgname</td>
<td>a character string giving the name of the package.</td>
</tr>
<tr>
<td>chname</td>
<td>a character string naming a DLL (also known as a dynamic shared object or library) to load.</td>
</tr>
<tr>
<td>libpath</td>
<td>a character string giving the complete path to the package.</td>
</tr>
</tbody>
</table>

Examples

# in a package namespace:
.onLoad <- function(libname=NULL, pkgname){
  pkgmaker::onLoad(libname, pkgname)
}

# in a package namespace:
.onUnload <- function(libpath){
  pkgmaker::onUnload(libpath)
}
option_symlink  

option_symlink creates a symbolic link to option x.

Description

option_symlink creates a symbolic link to option x.

is_option_symlink tests if x is a symbolic link option.

option_symlink_target returns the end target option of a symbolic link option x.

as.package_options creates an object such as the ones used to stores package specific options.

The method [[ is equivalent to options() or getOption(...): e.g. obj[[]] returns the list of options defined in obj, and obj[['abc']] returns the value of option 'abc'.

packageOptions provides access to package specific options from a given package that were defined with setupPackageOptions, and behaves as the base function options.

listPackageOptions returns the names of all option currently defined with setupPackageOptions.

Usage

option_symlink(x)

is_option_symlink(x, opts)

option_symlink_target(x, opts)

as.package_options(..., defaults = NULL)

## S3 method for class 'package_options'
x[[...]]

packageOptions(..., PACKAGE = packageName())

listPackageOptions()

Arguments

x  a character string, a list or an object of class package_options.

opts  a list of options

...  arguments passed to getOption (only first one is used).

defaults  NULL or a list of default options with their values.

PACKAGE  a package name

Value

listPackageOptions: a character vector (possibly empty).
Examples

listPackageOptions()

---

**orderVersion**  
*Ordering Version Numbers*

---

### Description

Orders a vector of version numbers, in natural order.

### Usage

```r
orderVersion(x, ..., decreasing = FALSE)
sortVersion(x, ...)
```

### Arguments

- `x` a character vector of version numbers
- `...` extra parameters passed to `orderVersion` and `order`
- `decreasing` a logical that indicates if the ordering should be decreasing

### Examples

```r
v <- c('1.0', '1.03', '1.2')
order(v)
orderVersion(v)

sort(v)
sortVersion(v)
```
packageData

Loading Package Data

Description
Loads package data using data, but allows the user to avoid NOTEs for a ‘non visible binding variable’ to be thrown when checking a package. This is possible because this function returns the loaded data.

Usage
packageData(list, envir = .GlobalEnv, ..., options = NULL, stringsAsFactors = getOption("stringsAsFactors", TRUE))

ldata(list, ...)

Arguments
- list: character vector containing the names of the data to load.
- envir: the environment where the data should be loaded.
- ...: other arguments eventually passed to data.
- options: list of R options to set before calling data. This may be useful the data is shipped as an R script.
- stringsAsFactors: logical that indicates if character columns of tabular data should be converted into factors.

Value
the loaded data.

Functions
- ldata: loads a package data in the parent frame. It is a shortcut for packageData(list, ..., envir=parent.frame)

Examples

```r
## Not run: mydata <- packageData('mydata')

## Not run:
# in a package' source => won't issue a NOTE
myfunction function(){
  mydata <- ldata('mydata')
```
packageEnv

}  
## End(Not run)

---

**Description**

packageEnv is a slight modification from `topenv`, which returns the top environment, which in the case of development packages is the environment into which the source files are loaded by `load_all`.

**Usage**

```r
packageEnv(pkg, skip = FALSE, verbose = FALSE)

topns_name(n = 1L, strict = TRUE, unique = TRUE)

topns(strict = TRUE)

packageName(envir = packageEnv(), .Global = FALSE, rm.prefix = TRUE)

str_ns(envir = packageEnv())

packagePath(..., package = NULL, lib.loc = NULL, check = TRUE)

isPackageInstalled(..., lib.loc = NULL)

as_package(x, ..., quiet = FALSE, extract = FALSE)
```

**Arguments**

- `pkg` package name. If missing the environment of the runtime caller package is returned.
- `skip` a logical that indicates if the calling namespace should be skipped.
- `verbose` logical that toggles verbosity
- `n` number of namespaces to return
- `strict` a logicalical that indicates if the global environment should be considered as a valid namespace.
- `unique` logical that indicates if the result should be reduced to contain only one occurrence of each namespace.
- `envir` environment where to start looking for a package name. The default is to use the `runtime` calling package environment.
.Global

a logical that indicates if calls from the global environment should throw an error (FALSE: default) or the string 'R_GlobalEnv'.

rm.prefix

logical that indicates if an eventual prefix 'package:' should be removed from the returned string.

... arguments passed to file.path.

color

optional name of an installed package

lib.loc

path to a library of R packages where to search the package

check

logical that indicates if an error should be thrown if the path to the package root directory cannot be found. If this is the case and check = FALSE, then the function returns NULL.

x

package specified by its installation/development path or its name as 'package:*'.

quiet

a logical that indicate if an error should be thrown if a package is not found. It is also passed to find.package.

extract

logical that indicates if DESCRIPTION of package source files should be extracted. In this case there will be no valid path.

Value

packageEnv: packageEnv returns an environment

packageName: a character string

packagePath: a character string

Functions

• topns.name: returns the name of the runtime sequence of top namespace(s), i.e. the name of the top calling package(s), from top to bottom.

The top namespace is is not necessarily the namespace where topns.name is effectively called. This is useful for packages that define functions that need to access the calling namespace, even from calls nested into calls to another function from the same package – in which case topenv would not give the desired environment.

• topns: returns the runtime top namespace, i.e. the namespace of the top calling package, possibly skipping the namespace where topns is effectively called. This is useful for packages that define functions that need to access the calling namespace, even from calls nested into calls to another function from the same package – in which case topenv would not give the desired environment.

• packageName: returns the current package’s name. It was made internal from version 0.16, since the package utils exported its own packageName function in R-3.0.0.

• str.ns: formats a package environment/namespace for log/info messages.

• packagePath: returns the current package’s root directory, which is its installation/loading directory in the case of an installed package, or its source directory served by devtools.

• isPackageInstalled: checks if a package is installed.

• as.package: an enhanced version of as.package, that is not exported not to mask the original function. It could eventually be incorporated into devtools itself. Extra arguments in ... are passed to find.package.
packageReference  

**Package References**

**Description**

Create a citation string from package specific BibTeX entries, suitable to be used in Rd files. The entries are looked in a file named REFERENCES.bib in the package’s root directory (i.e. inst/ in development mode).

**Usage**

```r
packageReference(key, short = FALSE, PACKAGE = NULL)
```

**Arguments**

- `key`  
  character vector of BibTeX keys
- `short`  
  logical that indicates if the reference should be shorten as First Author et al. if it has more than one author.
- `PACKAGE`  
  package in which the BiBTeX entry is defined.

**Value**

a character string containing the text formatted BibTeX entries

---

packageRegistry  

**Package Registry**

**Description**

packageRegistry provides ways to create query package specific registries.

**Usage**

```r
packageRegistry(regname = NULL, quiet = FALSE, entry = FALSE, update = !entry, package = toplevel(parent.frame()))

packageRegistries(regname = NULL, package = NULL, primary = FALSE)

hasPackageRegistry(regname = NULL, package)

setPackageRegistry(regname, regobj, description = "", entrydesc = NA, ..., package = toplevel(parent.frame())), overwrite = FALSE)

setPackageRegistryEntry(regname, key, ..., overwrite = FALSE, verbose = FALSE, where = toplevel(parent.frame()), msg = NULL)
```
Arguments

**regname**
Name of a sub-registry, used as its identifier.

**quiet**
a logical that indicates that one should return the (meta-)registry if it exists, or NULL otherwise, without throwing any error.

**entry**
logical that indicates if the corresponding meta registry entry should be directly returned, without any other processing.

**update**
logical that indicates if the package registry should be updated, by adding/removing entries from other loaded/unloaded packages.

**package**
package where to store or look for the registry.

**primary**
logical that indicates if only primary registries should be listed.

**regobj**
a registry object or a single character string that indicates the class of the objects that are stored in the sub-registry. See details for the list of the sub-registry's fields in this latter case.

**description**
short description line about the registry. It is recommended to provide such description as it makes clearer the purpose of the registry. This description is shown when the registry object is printed/formated/listed.

**entrydesc**
human readable description that is used in log messages when registering/removing entries.

**overwrite**
a logical that indicate if an existing registry with the same name should be overwritten if it exists.

**key**
entry identifier.

**verbose**
a logical that indicates if verbosity should be toggle on.

**where**
package name or namespace that owns the registry.

**msg**
addon message to print at the end of the output log line, when verbose=TRUE.

Details

Package registries are organised in a meta-registry (a registry of registries) within a package’s namespace. Each registry can be used to store sets of built-in or user-defined objects in an organised way, e.g. algorithms or datasets.

A package meta-registry is a registry object, whose entries are registry objects themselves. A sub-registry entry is defined by the following fields:

**key** The sub-registry’s accession key/identifier (a character string).

**regobj** The sub-registry itself (a registry object)

**description** Human readable description of the purpose of the registry (a character string)

**description** Short human readable description of the type of entries (a character string)

**package** owner package, which is forced to be the package in which the meta registry is defined.
parent  The name of the package that holds the parent registry, which we call the primary package. This field is non empty for cross-package registries, i.e. registries that derive from primary package’s own registry. Their entries are defined when (lazy-)loading the dependent package’s namespace.

Note that this function cannot be called from the global environment, but from a package namespace, e.g., when a package is lazy-loaded on installation or loaded via the function load_all from the devtools package.

Value

packageRegistry: a registry object or NULL (see argument quiet).

Functions

- packageRegistries: lists registries from loaded packages.
- hasPackageRegistry: tells if a given package has a meta-registry or a given registry.
- setPackageRegistry: creates a package-specific registry within a package.
  Each package sub-registry has its own set of fields. Sub-registries defined by passing a character string in argument regobj of setPackageRegistry have the following fields: `key` and `object`
- setPackageRegistryEntry: adds an entry in a package registry.

packageTestEnv

Returns the package internal environment where unit tests are stored.

Description

Returns the package internal environment where unit tests are stored.

Usage

packageTestEnv(pkg)

Arguments

pkg  package name. If missing the caller’s package is assumed.
postponeAction

---

**parsePackageCitation**  *Formatting Package Citations in Sweave/knitr Documents*

**Description**

Formatting Package Citations in Sweave/knitr Documents

**Usage**

```
parsePackageCitation(x)
```

**Arguments**

- `x`  
  output document, as a single string.

---

**pkgmaker-deprecated**  *Deprecated Functions in pkgmaker*

**Description**

These functions have been deprecated and will be defunct in the next release.

**Usage**

```
requirePackage(pkg, ...)
```

**Arguments**

- `pkg`  
  package name to load.
- `...`  
  extra arguments

---

**postponeAction**  *Postponing Actions*

**Description**

This function implements a mechanism to postpone actions, which can be executed at a later stage. This is useful when developing packages, where actions that need to be run in the `link(.onLoad)` function but can be defined close to their context.
quickinstall

Usage

postponeAction(expr, key = digest(tempfile()), group = NULL,
    envir = topns(strict = FALSE), verbose = getOption("verbose"))

runPostponedAction(group = NULL, verbose = getOption("verbose"))

Arguments

expr  expression that define the action to postpone. Currently only functions are supported.
key   identifier for this specific action. It should be unique across the postponed actions from the same group.
group optional parent action group. This enables to define meaningful sets of actions that can be run all at once.
envir environment in which the action should be executed. Currently not used.
verbose logical that toggles verbose messages.

Examples

opt <- options(verbosE=2)

# define actions
postponeAction(function(){print(10)}, "print")
postponeAction(function(){print(1:10)}, "more")
postponeAction()
# execute actions
runPostponedAction()
runPostponedAction()
# restore options
options(opt)

quickinstall  Quick Installation of a Source Package

Description

Builds and install a minimal version of a package from its source directory.

Usage

quickinstall(path, destdir = NULL, vignettes = FALSE, force = TRUE, ...,
    lib.loc = if (!is.null(destdir)) TRUE)
Arguments

path          path to the package source directory
destdir      installation directory. If NULL, the package is installed in the default installation library. If NA, the package is installed in a temporary directory, whose path is returned as a value.
vignettes    logical that indicates if the vignettes should be rebuilt and installed.
force        logical that indicates if the package should be installed even if a previous installation exists in the installation library.
...
lib.loc      extra arguments passed to \texttt{R.CMD}

Value

The path of the library where the package was installed.

\begin{tabular}{ll}
\texttt{R.exec} & \textit{Executing R Commands} \\
\end{tabular}

Description

Functions to execute R commands.

Usage

\texttt{R.exec(..., lib.loc = NULL)}

\texttt{R.CMD(cmd, ...)}

\texttt{R.SHLIB(libname, ...)}

Arguments

...          extra arguments that are concatenated and appended to the command.
lib.loc      logical that indicates if the current library locations should be used. If a character vector, then it is used as the library path specification.

\texttt{cmd} \hspace{1cm} \texttt{libname} command to run, e.g. `check` or `INSTALL`.

Functions

\begin{itemize}
\item \texttt{R.exec}: executes a single R command via \texttt{system2}.
\item \texttt{R.CMD}: executes R CMD commands.
\item \texttt{R.SHLIB}: executes R CMD SHLIB commands.
\end{itemize}
RdSection2latex  Format Rd Sections into LatTeX

Description

This function extract sections from Rd files and convert them into LaTeX code. This can be useful to include Rd text into vignettes, hence keeping them up to date.

Usage

RdSection2latex(topic, package, i = 1L, notitle = TRUE)

Arguments

- topic: Rd topic
- package: package in which to search the topic
- i: index of the section to format
- notitle: logical that indicates if the section’s title should be removed

Example section

This is a nice section, with a bullet list:

- tata
- toto

Examples

RdSection2latex('RdSection2latex', package = 'pkgmaker')

read.yaml_section  Reads YAML Options Embbeded into a File

Description

Reads YAML Options Embbeded into a File

Usage

read.yaml_section(section, file = "~/.Rprofile", text = NULL)
Arguments

section  section name to lookup in the file. In the file this defined by paired tags "#{section_name}>", "</#{section_name}>" or a single tag "#{section_name@file_path}" that redirect to a YAML file.

file  path to the file to parse. Default is to parse the user’s .Rprofile.

text  text to parse. If provided, then argument file is not used.

regfetch  Finds an entry in a registry.

Description

This function provides extra control on how entries are queried from a registry object.

Usage

regfetch(regobj, ..., all = FALSE, error = TRUE, exact = FALSE, KEYS = NULL, verbose = FALSE, entry = FALSE, msg = NULL)
pkgreg_fetch(regname, ..., msg = NULL, where = toplevel(parent.frame()))
pkgreg_remove(regname, ..., msg = NULL, where = toplevel(parent.frame()), quiet = FALSE)

Arguments

regobj  a registry object
...  key value(s) to look up. If multiple indexes are used, then the primary key should come first.
all  logical to indicate if hidden keys (starting with a '.') should be returned and output in message.
error  a logical that indicates if an error should be thrown if the key has no match or multiple matches
exact  a logical that indicates if matching should be exact or partial. Note that if exact matches exist then they are returned, independently of the value of exact.
KEYS  alternative way of passing the key value(s). If not missing, then arguments in ... are discarded.
verbose  a logical that indicates if verbosity should be toggle on
entry  a logical that indicates if the
msg  a header to use in case of error.
regname  Name of a sub-registry, used as its identifier.
where  package name or namespace that owns the registry.
quiet  a logical that indicates if the operation should be performed quietly, without throwing errors or warnings.
Functions

- **pkgreg_fetch**: fetches entries in a package registry, as set up by `setPackageRegistry`. It loads the requested package registry and uses `regfetch` to retrieve data from it.
- **pkgreg_remove**: removes an entry from a package registry.

---

**render_notes**

**Renders rmarkdown Documents Using User Default Options**

---

Description

Renders rmarkdown Documents Using User Default Options

Usage

```r
render_notes(input, output_format = NULL, output_options = NULL, ...,
              .config = NULL)
```

Arguments

- **input**: Input file (R script, Rmd, or plain markdown).
- **output_format**: R Markdown output format to convert to. Pass "all" to render all formats defined within the file. Pass the name of a format (e.g. "html_document") to render a single format or pass a vector of format names to render multiple formats. Alternatively you can pass an output format object; e.g. `html_document()`. If NULL is passed then the output format is the first one defined in the YAML metadata of the input file (defaulting to HTML if none is specified).
- **output_options**: List of output options that can override the options specified in metadata (e.g. could be used to force `self_contained` or `mathjax = "local"`). Note that this is only valid when the output format is read from metadata (i.e. not a custom format object passed to `output_format`).
- **...**: other arguments passed to `render`
- **.config**: location of the default options (a YAML file). Default behaviour is to look for file `.rmarkdown.yaml` in the user’s home directory, or, if missing, for a yaml section `rmarkdown::render` in the user’s R profile.

See Also

- `read.yaml_section`
require.quiet

Loading Packages

Description
require.quiet silently requires a package, and qrequire is an alias to require.quiet.

Usage
require.quiet(...)  
qrequire(...)  
qlibrary(...)  
require(msg, package, lib.loc = NULL, quietly = FALSE)

reorder_columns Reordering Columns

Description
Reorders columns according to a prefered target order

Usage
reorder_columns(x, target, decreasing = FALSE)

Arguments

x an object with columns, such as a matrix or a data.frame, or from a class that support subsetting via x[, i, drop = FALSE] and has a method colnames.
target a character or named numeric vector that specifies the column prefered order. If a numeric vector, then its names are assumed to correspond to columns, and its values determine the target order – according to argument decreasing.
decreasing logical that indicates in which direction a numeric target vector should be ordered.

Details
Column names will be reordered so that their order match the one in target. Any column that does not appear in target will be put after those that are listed in target.

Value
an object of the same type and dimension
requireRUnit

Arguments

... extra arguments passed to library or require.
msg error message to use, to which is appended the string `requires package <pkg>` to build the error message.
package name of the package to load.
lib.loc a character vector describing the location of \texttt{R} library trees to search through, or NULL. The default value of NULL corresponds to all libraries currently known to \texttt{libPaths}(). Non-existent library trees are silently ignored.
quietly a logical. If \texttt{TRUE}, no message confirming package attaching is printed, and most often, no errors/warnings are printed if package attaching fails.

Functions

- \texttt{qlibrary}: silently loads a package.
- \texttt{mrequire}: tries loading a package with base require and stops with a – custom – error message if it fails to do so.

See Also

Other require: \texttt{irequire}

Examples

```r
mrequire("Running this example", "stringr")
try( mrequire("Doing impossible things", "notapackage") )
```

requireRUnit 

Load RUnit Compatible Package

Description

Loads the package responsible for the implementation of the RUnit framework, choosing amongst ‘RUnitX’, ‘svUnit’ and ‘RUnit’.

Usage

requireRUnit(...)

Arguments

... arguments not used.
**Value**

nothing

---

**rnw**  
*Utilities for Vignettes*

**Description**

*rnw* provides a unified interface to run vignettes that detects the type of vignette (Sweave or *knitr*), and which Sweave driver to use (either automatically or from an embedded command \`VignetteDriver` command).

**Usage**

```r
rnw(x, file = NULL, ..., raw = FALSE)

isManualVignette()

as.rnw(x, ..., load = TRUE)

rnwCompiler(x, verbose = TRUE)

rnwWrapper(x, verbose = TRUE)

rnwDriver(x)

rnwIncludes(x)

rnwChildren(x)

vignetteMakefile(package = NULL, skip = NULL, print = TRUE,
                 template = NULL, temp = FALSE, checkMode = isCHECK() ||
                 vignetteCheckMode(), user = NULL, tests = TRUE)

compactVignettes(paths, ...)
```

**Arguments**

- **x**: vignette source file specification as a path or a *rnw* object.
- **file**: output file
- **...**: extra arguments passed to *as.rnw* that can be used to force certain building parameters.
- **raw**: a logical that indicates if the raw result for the compilation should be returned, instead of the result file path.
- **load**: logical to indicate if all the object’s properties should loaded, which is done by parsing the file and look up for specific tags.
verbose logical that toggles verbosity
package package name. If NULL, a DESCRIPTION file is looked for one directory up: this meant to work when building a vignette directly from a package's 'vignettes' sub-directory.
skip Vignette files to skip (basename).
print logical that specifies if the path should be printed or only returned.
template template Makefile to use. The default is to use the file “vignette.mk” shipped with the package pkgmaker and can be found in its install root directory.
temp logical that indicates if the generated makefile should using a temporary filename (TRUE), or simply named “vignette.mk”
checkMode logical that indicates if the vignettes should be generated as in a CRAN check (TRUE) or in development mode, in which case pdflatex, bibtex, and, optionally, qpdf are required.
user character vector containing usernames that enforce checkMode=TRUE, if the function is called from within their session.
tests logical that enables the compilation of a vignette that gathers all unit test results. Note that this means that all unit tests are run before generating the vignette. However, unit tests are not (re)-run at this stage when the vignettes are built when checking the package with R CMD check.
paths A character vector of paths to PDF files, or a length-one character vector naming a directory, when all ‘.pdf’ files in that directory will be used.

Functions

• isManualVignette: tells if a vignette is being run through the function runVignette of pkgmaker, allowing disabling behaviours not allowed in package vignettes that are checked via R CMD check.
• as.rnw: creates a S3 rnw object that contains information about a vignette, e.g., source filename, driver, fixed included files, etc..
• rnwCompiler: tries to detect the vignette compiler to use on a vignette source file, e.g., Sweave or knitr.
• rnwWrapper: tries to detect the type of vignette and if it is meant to be wrapped into another main file.
• rnwDriver: tries to detect Sweave driver to use on a vignette source file, e.g., SweaveCache, highlight, etc..
• rnwIncludes: detects fixed includes, e.g., image or pdf files, that are required to build the final document.
• rnwChildren: detects included vignette documents and return them as a list of vignette objects.
• vignetteMakefile: returns the path to a generic makefile used to make vignettes.
• compactVignettes: compacts vignette PDFs using either gs_quality='none' or 'ebook', depending on which compacts best (as per CRAN check criteria).

<table>
<thead>
<tr>
<th>Arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
</tr>
<tr>
<td>version</td>
</tr>
<tr>
<td>unique</td>
</tr>
</tbody>
</table>
Functions

- `getBiocMirror`: is a shortcut for `getOption('BioC_mirror')`, which returns the current Bioconductor mirror as used by biocLite.
- `getBiocRepos`: returns urls to all Bioconductor repositories on a given mirror.
- `setCRANMirror`: sets the preferred CRAN mirror.

---

**setClassRegistry**

*Automatic S4 Class for Registry Entries*

### Description

Automatic S4 Class for Registry Entries

### Usage

```r
setClassRegistry(registry, Class, ...)
```

### Arguments

- **registry**: a registry object
- **Class**: name of the class to generate
- **...**: extra arguments passed to `setClass`.

---

**setPackageExtraHandler**

*Install/Run Extra Things After Standard Package Installation*

### Description

These functions define a framework to register actions for which default sets of arguments can be defined when (lazy-)loading a package, and run later on, e.g., after the package is installed using dedicated commands.

`setPackageExtraHandler` defines main action handler functions, for which actions are defined as a set of arguments and registered using `setPackageExtra`. 
Usage

setPackageExtraHandler(handler, fun, ...)

packageExtraHandler(handler = NULL, ...)

setPackageExtra(handler, extra, ...)

packageExtra(handler = NULL, extra = NULL, package = NULL, .wrap = FALSE)

packageExtraRunner(handler)

install.extras(package, extra = NULL, handler = NULL, ..., .verbose = getOption("verbose"))

install.extrapackages(package, extra = NULL, handler = NULL, ..., .verbose = getOption("verbose"))

Arguments

- **handler**: name of a handler, e.g. 'install'. It must be unique across all handlers registered by any other packages.
- **fun**: handler function that will be called with the arguments registered with packageExtra(name, ...)
- **extra**: extra arguments passed to internal function calls. In packageExtraHandler, these are passed to pkgreg_fetch. In setPackageExtra, these define default arguments for the handler function. These are overwritten by arguments in the call to runner function if any.
- **package**: name of the extra action.
- **package**: package name where to store/look for the internal registries. End users should not need to use this argument.
- **.wrap**: logical that indicates if a function that runs the extra action should be returned or only the default arguments
- **.verbose**: logical that indicates if verbose messages about the extra actions being run should be displayed.

Value

setPackageExtraHandler: the runner function associated with the newly registered handler, as built by packageExtraRunner.

Functions

- **packageExtraHandler**: retrieves a given handler from the registry.
- **setPackageExtra**: registers extra actions for a given handler.

For example, calling setPackageExtra('install', pkgs='non_CRAN_pkg', repos='http://non-standard-repos') in a source file of package 'myPkg' registers the call install.packages('non_CRAN_pkg', repos='http://non-standard-repos')
setupPackageOptions

Package Specific Options

Description

The following functions to access/set the options from the set are assigned in envir:

<subset>Options
<subset>GetOption

Usage

setupPackageOptions(..., NAME = NULL, ENVIR = toenv(parent.frame()),
RESET = isLoadingNamespace())

Arguments

... a single named list or named arguments that provide the default options and their values.
NAME name of the set of options. This is used as a prefix for the name of the associated
global option: package:<name>.
ENVIR environment where the option wrapper functions will be defined. No function is
defined if ENVIR=NULL
RESET a logical that indicates whether the option set should overwrite one that already
exists if necessary. The default is FALSE (i.e. no reset), except when loading a
namespace, either from an installed package or a development package – with
devtools. If FALSE, an error is thrown if trying to setup options with the same name.
**simpleRegistry**  
*Simple Package Registry*

**Description**

Simple Package Registry

**Usage**

```r
simpleRegistry(name, envir = topenv(parent.frame()), verbose = FALSE)
```

**Arguments**

- `name`: name of the registry object, with which it will be assigned in `envir`.
- `envir`: environment where to store the registry object. Defaults to the caller’s top environment.
- `verbose`: logical that toggle a verbose message when the object is first created.

---

**source_files**  
*Source Multiple Files*

**Description**

Vectorised version of `source`.

**Usage**

```r
source_files(x, pattern = NULL, ...)
```

**Arguments**

- `x`: character vector containing filenames
- `pattern`: an optional regular expression. Only file names which match the regular expression will be returned.
- `...`: extra arguments passed to `source`.
Description

Computes which characters differ between two strings.

Usage

\texttt{str\_diff(x, y)}

Arguments

\begin{itemize}
  \item \texttt{x} \hspace{1cm} a single string
  \item \texttt{y} \hspace{1cm} a single string
\end{itemize}

Value

an integer vector containing the index of all mis-matched characters in the first string.

Examples

\begin{verbatim}
# strings to compare
x <- "once upon a time"
y <- "once upon a time there was"
z <- "once upon two times"

# diff: x - y
d <- str\_diff(x, y)
d
str(d)

# other comparisons
str\_diff(y, x)
str\_diff(x, x)
str\_diff(x, z)
str\_diff(y, z)
\end{verbatim}
str_out

**Description**

str_out formats character vectors for use in show methods or error/warning messages.

**Usage**

```r
str_out(x, max = 3L, quote = is.character(x), use.names = FALSE,
    sep = ",", total = FALSE)

str_desc(object, exdent = 0L)

str_fun(object)

str_class(x, max = Inf, ...)

str_pkg(pkg, lib.loc = NULL)

str_md5sum(x)

str_hash(x, algo = "md5")

str_bs(x)
```

**Arguments**

- **x** character vector
- **max** maximum number of values to appear in the list. If x has more elements than `max`, a ",..." suffix is appended.
- **quote** a logical indicating whether the values should be quoted with single quotes (defaults) or not.
- **use.names** a logical indicating whether names should be added to the list as `NAME=VAL`, ..., `z` (`<N> total)

- **sep** separator character
- **total** logical that indicates if the total number of elements should be appended to the formatted string as ",a", ..., `z` (`<N> total)

- **object** an R object
- **exdent** extra indentation passed to `str_wrap`, and used if the output should spread over more than one lines.
- **...** other arguments passed to `str_out`
- **pkg** package name
- **lib.loc** path to a library of R packages
- **algo** The algorithms to be used; currently available choices are md5, which is also the default, sha1, crc32, sha256, sha512, xxhash32, xxhash64 and murmur32.
Value

a single character string

Functions

- `str_desc`: builds formatted string from a list of complex values.
- `str_fun`: extracts and formats a function signature. It typically formats the output `capture.output(args(object))`.
- `str_class`: outputs the class(es) of an object using `str_out`.
- `str_pkg`: formats a package name and version
- `str_md5sum`: computes md5sum on character vector using `md5sum`.
- `str_hash`: computes hash of a character vector using `digest`.
- `str_bs`: substitutes backspace characters (`\b`) to produce a character string as it would be displayed in the console.

Author(s)

Renaud Gaujoux

`str_bs` was adapted from a proposal from Yihui Xie.

Examples

```r
x <- letters[1:10]
str_out(x)
str_out(x, 8)
str_out(x, Inf)
str_out(x, quote=FALSE)
str_out(x, total = TRUE)

str_fun(install.packages)
str_class(matrix())

# Backspace substitution
str_bs("abc")
str_bs("abc\b")
str_bs("abc\b\b")
str_bs("abc\bd")
str_bs("abc\bd\de\b")

# more complex example
x <- "\bab\nc\bd\n\babc\b\bd"
cat(x, "\n")
y <- str_bs(x)
y
cat(y, "\n")
```
### sVariable

**Global Static Variable**

**Description**

sVariable defines a function that acts as a global static variable.

**Usage**

sVariable(default = NULL)

**Arguments**

- **default**
  - default value for the static variable.

**Examples**

```r
# define variable
x <- sVariable(1)
# get value (default)
x()
# set new value: return old value
old <- x(3)
old
# get new value
x()
```

---

### Sys.getenv_value

**System Environment Variables**

**Description**

System Environment Variables

**Usage**

Sys.getenv_value(name, raw = FALSE)

**Arguments**

- **name**
  - variable name as a character string.
- **raw**
  - logical that indicates if one should return the raw value or the conversion of any false value to FALSE.
Value

the value of the environment variable as a character string or NA is the variable is not defined at all.

Examples

```r
# undefined returns FALSE
Sys.getenv_value('TOTO')
# raw undefined returns NA
Sys.getenv_value('TOTO', raw = TRUE)

Sys.setenv(TOTO='bla')
Sys.getenv_value('TOTO')

# anything false-like returns FALSE
Sys.setenv(TOTO='false'); Sys.getenv_value('TOTO')
Sys.setenv(TOTO='0'); Sys.getenv_value('TOTO')

# cleanup
Sys.unsetenv('TOTO')
```

### Description

Compares current R version with a given target version, which may be useful for implementing version dependent code.

### Usage

```r
testRversion(x, test = 1L)
```

### Arguments

- **x**
  - target version to compare with.
- **test**
  - numeric value that indicates the comparison to be carried out. The comparison is based on the result from `utils::compareVersion(R.version, x)`:
    - 1: is R.version > x?
    - 0: is R.version = x?
    - -1: is R.version < x?

### Value

a logical
Examples

```r
testRversion("2.14")
testRversion("2.15")
testRversion("10")
testRversion(">= 10")
testRversion(Rversion())
testRversion(paste0(’, Rversion()))
```

Description

The function `unitNtest` provides a way to write unit tests embedded within package source files. These tests are stored and organised in the package namespace, and can be run using the unified interface provided by the function `link{utest}`. Both Runit and testthat tests are supported – and automatically detected.

Usage

```r
unit.test(x, expr, framework = NULL, envir = parent.frame())
```

Arguments

- `x`: single character string used as test identifier/label
- `expr`: expression containing the actual test commands. It is not evaluated, but only stored in the package namespace.
- `framework`: Unit test framework
- `envir`: the definition environment of object x.

Value

a test function with no arguments that wrapping around expr
**unlist_**  
*Flatten a List Conserving Names*

**Description**

unlist2 is a replacement for `base::unlist` that does not mangle the names.

**Usage**

```r
unlist_(x, recursive = TRUE, use.names = TRUE, what.names = "inherited")
```

**Arguments**

- `x` See `?unlist`.
- `recursive` See `?unlist`.
- `use.names` See `?unlist`.
- `what.names` “inherited” or "full".

**Details**

Use this function if you don’t like the mangled names returned by the standard `unlist` function from the base package. Using `unlist` with annotation data is dangerous and it is highly recommended to use `unlist_` instead.

**Author(s)**

Herve Pages

**Source**

Bioconductor AnnotationDbi::unlist2

**Examples**

```r
x <- list(A=c(b=-4, 2, b=7), B=3:-1, c(a=1, a=-2), C=list(c(2:-1, d=55), e=99))
unlist(x)
unlist_(x)

# annotation maps (as in AnnotationDbi objects)
egids2pbids <- list('10' = 'a', '100' = c('b', 'c'), '1000' = c('d', 'e'))
egids2pbids
unlist(eids2pbids)  # 1001, 1002, 10001 and 10002 are not real
# Entrez ids but are the result of unlist()
# mangling the names!
unlist_(eids2pbids)  # much cleaner! yes the names are not unique
```
# but at least they are correct...

```
unlist_with_sep Flattens All List Levels Using Separated Names
```

**Description**

Flattens All List Levels Using Separated Names

**Usage**

```r
unlist_with_sep(x, sep = "/", use.names = TRUE, depth = Inf)
```

**Arguments**

- `x`: a list object, usually containing other lists – of lists.
- `sep`: character string used to separate each component of the final element names.
- `use.names`: logical that indicates if the original names of each the successive nested list elements should be used to build the final names of the result list.
- `depth`: maximum number of levels to unlist. Root level is 1.

**Examples**

```r
x <- list(X = list(a = 1,
             , b = list(b.1 = 2
             , b.2 = list(b.2.1 = 4, b.2.2 = data.frame())
             , b.3 = 3)
             , c = matrix()))
unlist_with_sep(x)
unlist_with_sep(x, "###")
```

---

**userData**

`userData` *User Data Directory* `userData` returns the path to a local directory/file where package-related user data can be stored. Note that a base directory is always created if necessary (see details).

**Description**

The package-specific user data base directory is the sub-directory `R-data/`, located in the user’s home or within a directory defined by global option 'userData.path'.

If in interactive mode, and the base directory does not exist yet, the user is asked if it should be created in his home directory. Otherwise, or if the user does not allow the creation in his home, this directory is created in the current R session’s temporary directory.
userIs

Usage

userIs(...)  
  userData(..., create = NULL, package = toenv(parent.frame()))

Arguments

  ...  path parts passed to file.path to be appended to the main path.
  create  logical that indicates if the base directory should be created if it does not exist.
  Note that directories – and files – under the base directory are not automatically created. The user should therefore care of it in the caller function if necessary.
  If create=TRUE, then the base directory is forced to be created in the user’s home directory. If create=FALSE, then the base directory is never created.
  See also section Details.

  package  name of the package associated with the user data path. It is used to prefix the path, within the user R data directory.

See Also

  tempdir

userIs  

Checking R User

Description

Tests if the current R user is amongst a given set of users.

Usage

userIs(user)

Arguments

  user  the usernames to check for, as a character vector.
using_something

Execute code in temporarily altered environment.

Description

These functions were extracted from the devtools package to make them available without a dependency to devtools.

Usage

using_envvar(new, code, action = "replace")
using_env(new, code)
using_locale(new, code)
using_collate(new, code)
using_dir(new, code)
using_libpaths(new, code)
using_lib(new, code)
using_options(new, code)
using_par(new, code)
using_path(new, code, add = TRUE, prepend = FALSE)

Arguments

new values for setting
code code to execute in that environment
action (for using_envvar only): should new values "replace", "suffix", "prefix" existing environmental variables with the same name.
add Combine with existing values? Currently for using_path only. If FALSE all existing paths are overwritten, which you don’t usually want.
prepend logical that indicates if the new paths should be added in front of the current ones.

Details

• using_dir: working directory
• using_collate: collation order
• using_envvar: environmental variables
• using_libpaths: library paths, replacing current libpaths
• using_lib: library paths, prepending to current libpaths
• using_locale: any locale setting
• using_options: options
• using_path: PATH environment variable
• using_par: graphics parameters

**Deprecation**

using_env will be deprecated in devtools 1.2 and removed in devtools 1.3

**Author(s)**

Hadley Wickham

**Examples**

```r
getwd()
using_dir(tempdir(), getwd())
getwd()

Sys.getenv("HADLEY")
using_envvar(c("HADLEY" = 2), Sys.getenv("HADLEY"))
Sys.getenv("HADLEY")

using_envvar(c("A" = 1),
  using_envvar(c("A" = 2), action = "suffix", Sys.getenv("A"))
)
```

---

**Description**

Run unit tests in a variety of settings. This is still very experimental.

**Usage**

```r
utest(x, ...)

## S4 method for signature '`function`'
utest(x, run = TRUE)

## S4 method for signature 'character'
```
Inferring Unit Test Framework

Inferring Unit Test Framework

Usage

utestFramework(x, eval = FALSE)

Arguments

x an filename, a function or the body of a function
eval a logical that indicates if the value of x should be used.

Value

the name of the framework as a character string or NULL if it could not be detected.
utestPath  

**Unit Tests Result Directory**

**Description**

Returns the path to the directory where the results of unit tests are stored. This path is used by `utest` to save unit test results, which are read by `makeUnitVignette` to update the unit test vignette when running R CMD check.

**Usage**

`utestPath(...)`

**Arguments**

`...` extra arguments passed to `packagePath`, e.g., package.

---

winbuild  

**Build a Windows Binary Package**

**Description**

Build a Windows Binary Package

**Usage**

`winbuild(path, outdir = ".", verbose = TRUE)`

**Arguments**

`path` path to a source or already installed package

`outdir` output directory

`verbose` logical or numeric that indicates the verbosity level

**Value**

Invisibly returns the full path to the generated zip file.
Examples

```r
# Not run:

# from source directory
winbuild('path/to/package/source/dir/')
# from tar ball
winbuild('PKG_1.0.tar.gz')

# End(Not run)
```

---

**write.bib**

*Defunct Functions in pkgmaker*

**Description**

These functions have been defunct or superseded by other functions.

**Usage**

`write.bib()`

**Arguments**

`...` *extra arguments*

---

**write.pkgbib**

*Generate a Bibtex File from Package Citations*

**Description**

Generates a Bibtex file from a list of packages or all the installed packages. It is useful for adding relevant citations in Sweave documents.

**Usage**

```r
write.pkgbib(entry = NULL, file = "Rpackages.bib", prefix = "", append = FALSE, verbose = TRUE)
```
Arguments

- **entry**: a `bibentry` object or a character vector of package names. If NULL, then the list of all installed packages is used.
- **file**: output Bibtex file. It can be specified as a filename (as a single character string), NULL for stdout, or a `link/connection` object. If file is a character string, an extension `.bib` is appended if not already present.
- **prefix**: character string to prepend to the generated packages’ Bibtex key.
- **append**: a logical that indicates that the Bibtex entries should be added to the file. If FALSE (default), the file is overwritten.
- **verbose**: a logical to toggle verbosity. If file=NULL, verbosity is forced off.

Details

Multiple citations are handled by adding a numeric suffix to the Bibtex key (other than the first/main citation) as "<pkgname>%i" (e.g. pkg, pkg2, pkg3).

This function has now been integrated by Romain Francois in the bibtex package.

Value

the list of Bibtex objects – invisibly.

Author(s)

Renaud Gaujoux, based on the function `rpackagesNbib` from Achim Zeileis (see References).

References

See Also

- `link/connection`, `link/bibentry`

Examples

```r
write.pkgbib(c('bibtex', 'utils', 'tools'), file='references')
bibs <- bibtex::read.bib('references.bib')
write.pkgbib(bibs, 'references2.bib')
md5 <- tools::md5sum(c('references.bib', 'references2.bib'))

# write to stdout
write.pkgbib(c('bibtex', 'utils', 'tools'), file=NULL)
```
# clean up
unlink(c('references.bib', 'references2.bib'))

**writeUnitVignette**  
*Writes Unit Tests Vignette*

**Description**

Writes a vignette that contains the results from running unit test suites.

**Usage**

```r
writeUnitVignette(pkg, file, results = NULL, check = FALSE)
```

**Arguments**

- **pkg**  
  Package name
- **file**  
  Output Sweave (.Rnw) file
- **results**  
  result file or output character vector
- **check**  
  logical that indicates the call was made from R CMD check, in which case the vignette is updated only if results of unit tests can be found in the unit test output directory, where they would have been generated by **utest**.
