Package ‘rentrez’

June 1, 2017

Version 1.1.0
Date 2017-05-22
Title Entrez in R
Depends R (>= 2.6.0)
Imports XML, httr (>= 0.5), jsonlite (>= 0.9)
Suggests testthat, knitr, rmarkdown

URL http://github.com/ropensci/rentrez

BugReports https://github.com/ropensci/rentrez/issues

Description Provides an R interface to the NCBI’s EUtils API allowing users to search databases like GenBank and PubMed, process the results of those searches and pull data into their R sessions.

VignetteBuilder knitr
License MIT + file LICENSE
RoxygenNote 6.0.1

  entrez_fetch ............................................................. 7
entrez_citmatch

Fetch pubmed ids matching specially formatted citation strings

Description

Fetch pubmed ids matching specially formatted citation strings

Usage

entrez_citmatch(bdata, db = "pubmed", retmode = "xml", config = NULL)

Arguments

bdata character, containing citation data. Each citation must be represented in a pipe-delimited format journal_title|year|volume|first_page|author_name|your_key The final field "your_key" is arbitrary, and can used as you see fit. Fields can be left empty, but be sure to keep 6 pipes.
db character, the database to search. Defaults to pubmed, the only database currently available
retmode character, file format to retrieve. Defaults to xml, as per the API documentation, though note the API only returns plain text
config vector configuration options passed to http::GET

Value

A character vector containing PMIDs

See Also

config for available configs
entrez_dbs

Examples

```r
ex_cites <- c("proc natl acad sci u s a|1991|88|3248|mann bj|test1|",
             "science|1987|235|182|palmenberg ac|test2")
entrez_citmatch(ex_cites)
```

---

**entrez_dbs**  
*List databases available from the NCBI*

**Description**

Retrieves the names of databases available through the EUtils API

**Usage**

```r
entrez_dbs(config = NULL)
```

**Arguments**

- **config**  
  config vector passed to `httr::GET`

**Value**

character vector listing available dbs

**See Also**

Other einfo: `entrez_db_links, entrez_db_searchable, entrez_db_summary, entrez_info`

**Examples**

```r
entrez_dbs()
```
entrez_db_links

List available links for records from a given NCBI database

Description

For a given database, fetch a list of other databases that contain cross-referenced records. The names of these records can be used as the db argument in `entrez_link`.

Usage

`entrez_db_links(db, config = NULL)`

Arguments

- db: character, name of database to search
- config: config vector passed to `httr::GET`

Value

An eInfoLink object (sub-classed from list) summarizing linked-databases. Can be coerced to a data-frame with `as.data.frame`. Printing the object the name of each element (which is the correct name for `entrez_link`, and can be used to get (a little) more information about each linked database (see example below).

See Also

`entrez_link`

Other einfo: `entrez_db_searchable, entrez_db_summary, entrez_dbs, entrez_info`

Examples

```r
taxid <- entrez_search(db="taxonomy", term="Osmeriformes")$ids
tax_links <- entrez_db_links("taxonomy")
tax_links
entrez_link(dbfrom="taxonomy", db="pmc", id=taxid)

sra_links <- entrez_db_links("sra")
as.data.frame(sra_links)
```
entrez_db_searchable  List available search fields for a given database

Description

Fetch a list of search fields that can be used with a given database. Fields can be used as part of the term argument to `entrez_search`

Usage

```r
entrez_db_searchable(db, config = NULL)
```

Arguments

- `db` character, name of database to get search field from
- `config` config vector passed to `httr::GET`

Value

An eInfoSearch object (subclassed from list) summarizing linked-databases. Can be coerced to a data-frame with `as.data.frame`. Printing the object shows only the names of each available search field.

See Also

- `entrez_search`

Other einfo: `entrez_db_links`, `entrez_db_summary`, `entrez_dbs`, `entrez_info`

Examples

```r
pmc_fields <- entrez_db_searchable("pmc")
pmc_fields[["AFFL"]]
entrez_search(db="pmc", term="Otago[AFFL]", retmax=0)
entrez_search(db="pmc", term="Auckland[AFFL]", retmax=0)

sra_fields <- entrez_db_searchable("sra")
as.data.frame(sra_fields)
```
entrez_db_summary

Retrieve summary information about an NCBI database

Description

Retrieve summary information about an NCBI database

Usage

entrez_db_summary(db, config = NULL)

Arguments

db character, name of database to summaries
config config vector passed to httr::GET

Value

Character vector with the following data
DbName Name of database
Description Brief description of the database
Count Number of records contained in the database
MenuName Name in web-interface to EUtils
DbBuild Unique ID for current build of database
LastUpdate Date of most recent update to database

See Also

Other einfo: entrez_db_links, entrez_db_searchable, entrez_dbs, entrez_info

Examples

tenrez_db_summary("pubmed")
Description

A set of unique identifiers must be specified with either the `db` argument (which directly specifies the IDs as a numeric or character vector) or a `web_history` object as returned by `entrez_link`, `entrez_search` or `entrez_post`. See Table 1 in the linked reference for the set of formats available for each database. In particular, note that sequence databases (nuccore, protein and their relatives) use specific format names (e.g., "native", "ipg") for different flavors of XML.

Usage

```r
entrez_fetch(db, id = NULL, web_history = NULL, rettype, retmode = "", parsed = FALSE, config = NULL, ...)
```

Arguments

db character, name of the database to use
id vector (numeric or character), unique ID(s) for records in database `db`. In the case of sequence databases, these IDs can take the form of an NCBI accession followed by a version number (e.g., AF123456.1 or AF123456.2).
web_history, a `web_history` object
rettype character, format in which to get data (e.g., fasta, xml...)
retmode character, mode in which to receive data, defaults to 'text'
parsed boolean should `entrez_fetch` attempt to parse the resulting file. Only works with XML records (including those with rettypes other than "xml") at present
config vector, `httr` configuration options passed to `httr::GET`
... character, additional terms to add to the request, see NCBI documentation linked to in references for a complete list

Details

For the most part, this function returns a character vector containing the fetched records. For XML records (including 'native', 'ipg', 'gbc' sequence records), setting `parsed` to TRUE will return an `XMLInternalDocument`.

Value

character string containing the file created
`XMLInternalDocument` a parsed XML document if `parsed=TRUE` and `rettype` is a flavor of XML.

References

See Also

config for available 'httr' configs

Examples

## Not run:
katipo <- "Latrodectus katipo[Organism]"
katipo_search <- entrez_search(db="nuccore", term=katipo)
katipo_seqs <- entrez_fetch(db="nuccore", id=katipo_search$ids, rettype="fasta")
#xml
katipo_seqs <- entrez_fetch(db="nuccore", id=katipo_search$ids, rettype="native")
## End(Not run)

### entrez_global_query

Find the number of records that match a given term across all NCBI Entrez databases

Description

Find the number of records that match a given term across all NCBI Entrez databases

Usage

entrez_global_query(term, config = NULL, ...)

Arguments

term the search term to use

config vector configuration options passed to httr::GET

... additional arguments to add to the query

Value

a named vector with counts for each a database

See Also

config for available configs

Examples

NCBI_data_on_best_butterflies_ever <- entrez_global_query(term="Heliconius")
**entrez_info**

Get information about EUtils databases

---

**Description**

Gather information about EUtils generally, or a given Eutils database. Note: The most common uses-cases for the einfo util are finding the list of search fields available for a given database or the other NCBI databases to which records in a given database might be linked. Both these use cases are implemented in higher-level functions that return just this information (`entrez_db_searchable` and `entrez_db_links` respectively). Consequently most users will not have a reason to use this function (though it is exported by `rentrez` for the sake of completeness.

**Usage**

```r
entrez_info(db = NULL, config = NULL)
```

**Arguments**

- `db` character database about which to retrieve information (optional)
- `config` config vector passed on to `httr::GET`

**Value**

XMLInternalDocument with information describing either all the databases available in Eutils (if `db` is not set) or one particular database (set by 'db')

**See Also**

- `config` for available `httr` configurations
- Other einfo: `entrez_db_links`, `entrez_db_searchable`, `entrez_db_summary`, `entrez_dbs`

**Examples**

```r
## Not run:
all_the_data <- entrez_info()
XML::xpathSApply(all_the_data, "//DbName", xmlValue)
entrez_dbs()

## End(Not run)
```
Get links to datasets related to records from an NCBI database

Description

Discover records related to a set of unique identifiers from an NCBI database. The object returned by this function depends on the value set for the cmd argument. Printing the returned object lists the names, and provides a brief description, of the elements included in the object.

Usage

entrez_link(dbfrom, web_history = NULL, id = NULL, db = NULL, cmd = "neighbor", by_id = FALSE, config = NULL, ...)

Arguments

dbfrom character Name of database from which the Id(s) originate
web_history a web_history object
id vector with unique ID(s) for records in database db.
db character Name of the database to search for links (or use "all" to search all databases available for db. entrez_db_links allows you to discover databases that might have linked information (see examples).
cmd link function to use. Allowed values include
  • neighbor (default). Returns a set of IDs in db linked to the input IDs in dbfrom.
  • neighbor_score. As ‘neighbor’, but additionally returns similarity scores.
  • neighbor_history. As ‘neighbor’, but returns web history objects.
  • acheck. Returns a list of linked databases available from NCBI for a set of IDs.
  • ncheck. Checks for the existence of links within a single database.
  • lcheck. Checks for external (i.e. outside NCBI) links.
  • llinks. Returns a list of external links for each ID, excluding links provided by libraries.
  • llinkslib. As 'llinks' but additionally includes links provided by libraries.
  • prlinks. As 'llinks' but returns only the primary external link for each ID.
by_id logical If FALSE (default) return a single elink objects containing links for all of the provided ids. Alternatively, if TRUE return a list of elink objects, one for each ID in id.
config vector configuration options passed to httr::GET
... character Additional terms to add to the request, see NCBI documentation linked to in references for a complete list
entrez_post

Value
An elink object containing the data defined by the cmd argument (if by_id=FALSE) or a list of such object (if by_id=TRUE).
file XMLInternalDocument xml file resulting from search, parsed with xmlTreeParse

Examples

pubmed_search <- entrez_search(db = "pubmed", term = "10.1016/j.ympev.2010.07.013[doi]")
linked_dbs <- entrez_db_links("pubmed")
linked_dbs
nucleotide_data <- entrez_link(dbfrom = "pubmed", id = pubmed_search$ids, db = "nuccore")
Sources for the full text of the paper
res <- entrez_link(dbfrom="pubmed", db="", cmd="llinks", id=pubmed_search$ids)
linkout_urls(res)

entrez_post Post IDs to Eutils for later use

Description
Post IDs to Eutils for later use

Usage
entrez_post(db, id = NULL, web_history = NULL, config = NULL, ...)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db</td>
<td>character Name of the database from which the IDs were taken</td>
</tr>
<tr>
<td>id</td>
<td>vector with unique ID(s) for records in database db.</td>
</tr>
<tr>
<td>web_history</td>
<td>A web_history object. Can be used to add to additional identifiers to an existing web environment on the NCBI</td>
</tr>
<tr>
<td>config</td>
<td>vector of configuration options passed to http::GET</td>
</tr>
<tr>
<td>...</td>
<td>character Additional terms to add to the request, see NCBI documentation linked to in references for a complete list</td>
</tr>
</tbody>

config for available httr configurations

Examples

## Not run:
so_many_snails <- entrez_search(db="nucore",
upload <- entrez_post(db="nucore", id=so_many_snails$id)
first <- entrez_fetch(db="nucore", retype="fasta", web_history=upload,
                      retmax=10)
second <- entrez_fetch(db="nucore", file_format="fasta", web_history=upload,
                       retstart=10, retmax=10)

## End(Not run)

entrez_search Search the NCBI databases using EUtils

Description

The NCBI uses a search term syntax where search terms can be associated with a specific search
field with square brackets. So, for instance “Homo[ORGN]” denotes a search for Homo in the “Organism” field. The names and definitions of these fields can be identified using entrez_db_searchable.

Usage

entrez_search(db, term, config = NULL, retmode = "xml",
              use_history = FALSE, ...)

Arguments

db character, name of the database to search for.
term character, the search term.
config vector configuration options passed to httr::GET
retmode character, one of json (default) or xml. This will make no difference in most cases.
use_history logical. If TRUE return a web_history object for use in later calls to the NCBI
... character, additional terms to add to the request, see NCBI documentation linked to in references for a complete list
Details

Searches can make use of several fields by combining them via the boolean operators AND, OR and NOT. So, using the search term "((Homo[ORGN] AND APP[GENE]) NOT Review[PTYP])" in PubMed would identify articles matching the gene APP in humans, and exclude review articles. More examples of the use of these search terms, and the more specific MeSH terms for precise searching, is given in the package vignette.

The `entrez_search` tutorial provides some tips on how to make the most of searches to the NCBI. In particular, the sections on uses of the "Filter" field and MeSH terms may in formulating precise searches.

Value

- **ids** integer Unique IDs returned by the search
- **count** integer Total number of hits for the search
- **retmax** integer Maximum number of hits returned by the search
- **web_history** A web_history object for use in subsequent calls to NCBI
- **QueryTranslation** character, search term as the NCBI interpreted it
- **file** either and XMLInternalDocument xml file resulting from search, parsed with `xmltreeparse` or, if `retmode` was set to json a list resulting from the returned JSON file being parsed with `fromJSON`.

References

See Also

- `config` for available `httr` configurations
- `entrez_db_searchable` to get a set of search fields that can be used in `term` for any database

Examples

```r
## Not run:
query <- "Gastropoda[Organism] AND COI[Gene]"
web_env_search <- entrez_search(db = "nuccore", query, use_history = TRUE)
cookie <- web_env_search$WebEnv
qk <- web_env_search$QueryKey
snail_coi <- entrez_fetch(db = "nuccore", WebEnv = cookie, query_key = qk,
file_format = "fasta", retmax = 10)

## End(Not run)

fly_id <- entrez_search(db = "taxonomy", term = "Drosophila")
#Oh, right. There is a genus and a subgenus name Drosophila...
#how can we limit this search
(tax_fields <- entrez_db_searchable("taxonomy"))
#"RANK" loots promising
tax_fields$RANK
```
Description

The NCBI offer two distinct formats for summary documents. Version 1.0 is a relatively limited summary of a database record based on a shared Document Type Definition. Version 1.0 summaries are only available as XML and are not available for some newer databases. Version 2.0 summaries generally contain more information about a given record, but each database has its own distinct format. 2.0 summaries are available for records in all databases and as JSON and XML files. As of version 0.4, rentrez fetches version 2.0 summaries by default and uses JSON as the exchange format (as JSON object can be more easily converted into native R types). Existing scripts which relied on the structure and naming of the "Version 1.0" summary files can be updated by setting the new version argument to "1.0".

Usage

```r
entrez_summary(db = "taxonomy", term = "Drosophila & Genus[RANK]"
```

Arguments

- `db` character Name of the database to search for
- `id` vector with unique ID(s) for records in database db. In the case of sequence databases these IDs can take form of an NCBI accession followed by a version number (eg AF123456.1 or AF123456.2)
- `web_history` A web_history object
- `version` either 1.0 or 2.0 see above for description
- `always_return_list` logical, return a list of esummary objects even when only one ID is provided (see description for a note about this option)
- `retmode` either "xml" or "json". By default, xml will be used for version 1.0 records, json for version 2.0.
- `config` vector configuration options passed to `httr::GET`
- `...` character Additional terms to add to the request, see NCBI documentation linked to in references for a complete list
Details

By default, entrez_summary returns a single record when only one ID is passed and a list of such records when multiple IDs are passed. This can lead to unexpected behaviour when the results of a variable number of IDs (perhaps the result of entrez_search) are processed with an apply family function or in a for-loop. If you use this function as part of a function or script that generates a variably-sized vector of IDs setting always_return_list to TRUE will avoid these problems. The function extract_from_esummary is provided for the specific case of extracting named elements from a list of esummary objects, and is designed to work on single objects as well as lists.

Value

A list of esummary records (if multiple IDs are passed and always_return_list if FALSE) or a single record.

file XMLInternalDocument xml file containing the entire record returned by the NCBI.

References

http://www.ncbi.nlm.nih.gov/books/NBK25499/#_chapter4_ESummary_

See Also

config for available configs

extract_from_esummary which can be used to extract elements from a list of esummary records

Examples

```r
pop_ids = c("307082412", "307075396", "307075338", "307075274")
pop_summ <- entrez_summary(db="popset", id=pop_ids)
extract_from_esummary(pop_summ, "title")

# clinvar example
res <- entrez_search(db = "clinvar", term = "BRCA1", retmax=10)
cv <- entrez_summary(db="clinvar", id=res$ids)
cv
extract_from_esummary(cv, "title", simplify=FALSE)
extract_from_esummary(cv, "trait_set")[1:2]
extract_from_esummary(cv, "gene_sort")
```

Description

Extract elements from a list of esummary records
Usage

extract_from_esummary(esummaries, elements, simplify = TRUE)

Arguments

esummaries A list of esummary objects
elements the names of the element to extract
simplify logical, if possible return a vector

Value

List or vector containing requested elements

linkout_urls

Extract URLs from an elink object

Description

Extract URLs from an elink object

Usage

linkout_urls(elink)

Arguments

elink elink object (returned by entrez_link) containing URLs

Value

list of character vectors, one per ID each containing of URLs for that ID.

See Also

entrez_link
parse_pubmed_xml

Summarize an XML record from pubmed.

Description

Note: this function assumes all records are of the type "PubmedArticle" and will return an empty record for any other type (including books).

Usage

parse_pubmed_xml(record)

Arguments

record Either an XMLInternalDocument or character the record to be parsed (expected to come from entrez_fetch)

Value

Either a single pubmed_record object, or a list of several

Examples

hox_paper <- entrez_search(db="pubmed", term="10.1038/nature08789[doi]")
hox_rel <- entrez_link(db="pubmed", dbfrom="pubmed", id=hox_paper$ids)
recs <- entrez_fetch(db="pubmed", id=hox_rel$links$pubmed_pubmed[1:3], rettype="xml")
parse_pubmed_xml(recs)

rentrez

rentrez

Description

rentrez provides functions to search for, discover and download data from the NCBI’s databases using their EUtils function.
Details

Users are expected to know a little bit about the EUtils API, which is well documented: http://www.ncbi.nlm.nih.gov/books/NBK25500/

The NCBI will ban IPs that don’t use EUtils within their user guidelines. In particular:

- Don’t send more than three request per second (rentrez enforces this limit)
- If you plan on sending a sequence of more than ~100 requests, do so outside of peak times for the US
- For large requests use the web history method (see examples for entrez_search or use entrez_post to upload IDs)
