TkRplot Tk Rplot
----------------

Description

Placing R graphics in a Tk image.

Usage

tkrplot(parent, fun, hscale=1, vscale=1)
tkrreplot(lab, fun = lab$fun, hscale=lab$hscale, vscale=lab$vscale)
tkpersp(x,y,z, theta = 30,phi = 30,expand = 0.5, r = sqrt(3), ...)

1
Arguments

- **parent**: parent of widget window
- **fun**: function of no arguments that creates the plot
- **lab**: a Tk Rplot label widget
- **hscale**: horizontal scale factor for image size
- **vscale**: vertical scale factor for image size
- **x**: as for `persp`
- **y**: as for `persp`
- **z**: as for `persp`
- **theta**: as for `persp`
- **phi**: as for `persp`
- **expand**: as for `persp`
- **r**: as for `persp`
- **...**: additional arguments for `persp`

Details

The function `tkrplot` creates and returns a Tk label widget containing a Tk image of type Rplot. For now the size is hard-wired. The plot is created by calling `fun` with a special device used to create the image.

The function `tkrreplot` calls `fun` to place a new plot in the Rplot widget `lab`.

`tkpersp` is called like `persp` but produces a plot in which some of the parameters of `persp` are controlled graphically.

Examples

```r
## not run:
## These cannot be run by examples() but should be OK when pasted
## into an interactive R session with the tcltk package loaded

tt <- tktoplevel()
b <- 1
img <- tkrplot(tt, function() plot(1:20,(1:20)^bb))
f <- function(...) {
  b <- as.numeric(tclvalue("bb"))
  if (b != bb) {
    bb <- b
    tkrreplot(img)
  }
}
s <- tkscale(tt, command = f, from = 0.05, to = 2.00, variable = "bb",
             showvalue = FALSE, resolution = 0.05, orient = "horiz")
tkpack(img, s)
## End(Not run)
```
