Index 131
The R Sleuth2 package

Description

Data sets from Ramsey and Schafer's "Statistical Sleuth (2nd ed)"

Details

This package contains a variety of datasets. For a complete list, use `library(help="Sleuth2")` or `Sleuth2Manual()`.

Author(s)

Original by F.L. Ramsey and D.W. Schafer
Modifications by Daniel W Schafer, Jeannie Sifneos and Berwin A Turlach
Maintainer: Berwin A Turlach <Berwin.Turlach@gmail.com>

Motivation and Creativity

Description

Data from an experiment concerning the effects of intrinsic and extrinsic motivation on creativity. Subjects with considerable experience in creative writing were randomly assigned to one of two treatment groups.

Usage

case0101

Format

A data frame with 47 observations on the following 2 variables.

Score creativity score
Treatment factor denoting the treatment group

Source

References

Examples

```r
str(case0101)
boxplot(Score~Treatment, case0101)
```

---

**Sex Discrimination in Employment**

Description

The data are the beginning salaries for all 32 male and all 61 female skilled, entry–level clerical employees hired by a bank between 1969 and 1977.

Usage

```r
case0102
```

Format

A data frame with 93 observations on the following 2 variables.

- **Salary**: starting salaries (in US$)
- **Sex**: sex of the clerical employee

Source

References

See Also

```r
case1202
```

Examples

```r
str(case0102)
boxplot(Salary~Sex, case0102)
```
As evidence in support of natural selection, Bumpus presented measurements on house sparrows brought to the Anatomical Laboratory of Brown University after an uncommonly severe winter storm. Some of these birds had survived and some had perished. Bumpus asked whether those that perished did so because they lacked physical characteristics enabling them to withstand the intensity of that particular instance of selective elimination. The data are on the humerus (arm bone) lengths for the 24 adult male sparrows that perished and for the 35 adult males that survived.

A data frame with 59 observations on the following 2 variables.

- **Humerus**: Humerus length of adult male sparrows (in inches)
- **Status**: factor variable indicating whether the sparrow perished or survived in a winter storm

**Source**

**Examples**

```r
str(case0201)
with(subset(case0201, Status=="Perished"), stem(Humerus, scale=10))
with(subset(case0201, Status=="Survived"), stem(Humerus))
```
Anatomical Abnormalities Associated with Schizophrenia

Description

Are any physiological indicators associated with schizophrenia? In a 1990 article, researchers reported the results of a study that controlled for genetic and socioeconomic differences by examining 15 pairs of monozygotic twins, where one of the twins was schizophrenic and the other was not. The researchers used magnetic resonance imaging to measure the volumes (in cm³) of several regions and subregions of the twins' brains.

Usage

case0202

Format

A data frame with 15 observations on the following 2 variables.

Unaffect volume of left hippocampus of unaffected twin (in cm³)
Affected volume of left hippocampus of affected twin (in cm³)

Source

References

Examples

str(case0202)
with(case0202, stem(Unaffect-Affected, scale=2))
### Description

Does dropping silver iodide onto clouds increase the amount of rainfall they produce? In a randomized experiment, researchers measured the volume of rainfall in a target area (in acre-feet) on 26 suitable days in which the clouds were seeded and on 26 suitable days in which the clouds were not seeded.

### Usage

case0301

### Format

A data frame with 52 observations on the following 2 variables.

- **Rainfall**: the volume of rainfall in the target area (in acre-feet)
- **Treatment**: a factor with levels "Unseeded" and "Seeded" indicating whether the clouds were unseeded or seeded.

### Source

### References

### Examples

```r
str(case0301)
boxplot(Rainfall ~ Treatment, case0301)
boxplot(log(Rainfall) ~ Treatment, case0301)
library(lattice)
bwplot(Treatment ~ log(Rainfall), case0301)
bwplot(log(Rainfall) ~ Treatment, case0301)
```
Description

In 1987, researchers measured the TCDD concentration in blood samples from 646 U.S. veterans of the Vietnam War and from 97 U.S. veterans who did not serve in Vietnam. TCDD is a carcinogenic dioxin in the herbicide called Agent Orange, which was used to clear jungle hiding areas by the U.S. military in the Vietnam War between 1962 and 1970.

Usage

data(case0302)

Format

A data frame with 743 observations on the following 2 variables.

- **Dioxin**: the concentration of TCDD, in parts per trillion
- **Veteran**: factor variable with two levels, "Vietnam" and "Other", to indicate the type of veteran

Source

References

Examples

```r
str(case0302)
boxplot(Dioxin ~ Veteran, case0302)
t.test(Dioxin ~ Veteran, case0302)
## To examine results with largest dioxin omitted
t.test(Dioxin ~ Veteran, case0302, subset=(Dioxin < 40))
```
Description

The number of space shuttle O-ring incidents for 4 space shuttle launches when the air temperatures was below 65 degrees F and for 20 space shuttle launches when the air temperature was above 65 degrees F.

Usage

case0401

Format

A data frame with 24 observations on the following 2 variables.

Incidents the number of O-ring incidents
Launch factor variable with two levels—"Cool" and "Warm"

Source

References

See Also

ex2011, ex2223

Examples

str(case0401)
stem(subset(case0401, Launch=="Cool", Incidents, drop=TRUE))
stem(subset(case0401, Launch=="Warm", Incidents, drop=TRUE))
Description

Educational researchers randomly assigned 28 ninth-year students in Australia to receive coordinate geometry training in one of two ways: a conventional way and a modified way. After the training, the students were asked to solve a coordinate geometry problem. The time to complete the problem was recorded, but five students in the “conventional” group did not complete the solution in the five minute allotted time.

Usage
case0402

Format

A data frame with 28 observations on the following 3 variables.

- **Time**: the time (in seconds) that the student worked on the problem
- **Treatmt**: factor variable with two levels—“Modified” and “Conventional”
- **Censor**: 1 if the individual did not complete the problem in 5 minutes, 0 if they did

Source

References

Examples

```r
str(case0402)
stem(subset(case0402, Treatmt=="Conventional", Time, drop=TRUE))
stem(subset(case0402, Treatmt=="Modified", Time, drop=TRUE))
wilcox.test(Time ~ Treatmt, case0402)
```
Diet Restriction and Longevity

Description

Female mice were randomly assigned to six treatment groups to investigate whether restricting dietary intake increases life expectancy. Diet treatments were:

1. "NP"—mice ate unlimited amount of nonpurified, standard diet
2. "N/N85"—mice fed normally before and after weaning. After weaning, ration was controlled at 85 kcal/wk
3. "N/R50"—normal diet before weaning and reduced calorie diet (50 kcal/wk) after weaning
4. "R/R50"—reduced calorie diet of 50 kcal/wk both before and after weaning
5. "N/R50 lopro"—normal diet before weaning, restricted diet (50 kcal/wk) after weaning and dietary protein content decreased with advancing age
6. "N/R40"—normal diet before weaning and reduced diet (40 Kcal/wk) after weaning.

Usage

case0501

Format

A data frame with 349 observations on the following 2 variables.

Lifetime the lifetime of the mice (in months)
Diet factor variable with six levels—"NP", "N/N85", "lopro", "N/R50", "R/R50" and "N/R40"

Source

References

Examples

str(case0501)
boxplot(Lifetime~Diet, width=c(rep(.8,6)), data=case0501, xlab="Diet", ylab="Lifetime in months")
summary(subset(case0501, Diet="NP", Lifetime))
Description

In 1968, Dr. Benjamin Spock was tried in Boston on charges of conspiring to violate the Selective Service Act by encouraging young men to resist being drafted into military service for Vietnam. The defence in the case challenged the method of jury selection claiming that women were underrepresented. Boston juries are selected in three stages. First 300 names are selected at random from the City Directory, then a venire of 30 or more jurors is selected from the initial list of 300 and finally, an actual jury is selected from the venire in a nonrandom process allowing each side to exclude certain jurors. There was one woman on the venire and no women on the final list. The defence argued that the judge in the trial had a history of venires in which women were systematically underrepresented and compared the judge’s recent venires with the venires of six other Boston area district judges.

Usage
case0502

Format

A data frame with 46 observations on the following 2 variables.

Percent  is the percent of women on the venire’s of the Spock trial judge and 6 other Boston area judges

Judge  a factor with levels "Spock’s", "A", "B", "C", "D", "E" and "F"

Source

References

Examples

str(case0502)
boxplot(Percent~Judge, data=case0502,
   xlab="Judge",ylab="Percentage of Women")
percent.spocks <- subset(case0502, Judge == "Spock's", Percent)
percent.others <- subset(case0502, Judge != "Spock's", Percent)
t.test( percent.spocks,percent.others)
summary(aov(Percent~Judge, case0502, subset = Judge != "Spock's"))
case0601

#as in Display 5.10
summary(aov(Percent~Judge, case0502))

---

case0601  Discrimination Against the Handicapped

Description

Study explores how physical handicaps affect people’s perception of employment qualifications. Researchers prepared 5 videotaped job interviews using actors with a script designed to reflect an interview with an applicant of average qualifications. The 5 tapes differed only in that the applicant appeared with a different handicap in each one. Seventy undergraduate students were randomly assigned to view the tapes and rate the qualification of the applicant on a 0-10 point scale.

Usage

case0601

Format

A data frame with 70 observations on the following 2 variables.

Score is the score each student gave to the applicant

Handicap is a factor variable with 5 levels—"None", "Amputee", "Crutches", "Hearing" and "Wheelchair"

Source

References

Examples

```r
str(case0601)
boxplot(Score~Handicap, data=case0601, ylab="Score")
aov.handicap <- aov(Score ~ Handicap, case0601)
summary(aov.handicap)
TukeyHSD(aov.handicap)

#Calculate confidence interval for linear combination
#((wheelchair+crutches)/2 - (amputee+hearing))/2 as in Display 6.4
mean.handicaps <- with(case0601, tapply(Score, Handicap, mean))
var.handicaps <- with(case0601, tapply(Score, Handicap, var))
```
n <- 14
s.pooled <- sqrt(sum((n-1)*var.handicaps)/sum((n-1)*5))

## either
cr.wh <- mean.handicaps["Wheelchair"] + mean.handicaps["Crutches"]
am.he <- mean.handicaps["Amputee"] + mean.handicaps["Hearing"]
g <- cr.wh/2 - am.he/2
## or
contr <- c(0, -1, 1, -1, 1)/2
g <- sum(contr * mean.handicaps)

se.g <- s.pooled * sqrt(sum(contr^2)/n)
t.65 <- qt(.975, 65)
## ci
g + c(-1,1) * t.65 * se.g

---

**Mate Preference of Platyfish**

**Description**

Do female Platyfish prefer male Platyfish with yellow swordtails? A.L. Basolo proposed and tested a selection model in which females have a pre-existing bias for a male trait even before the males possess it. Six pairs of males were surgically given artificial, plastic swordtails—one pair received a bright yellow sword, the other a transparent sword. Females were given the opportunity to engage in courtship activity with either of the males. Of the total time spent by each female engaged in courtship during a 20 minute observation period, the percentages of time spent with the yellow-sword male were recorded.

**Usage**

case0602

**Format**

A data frame with 84 observations on the following 3 variables.

- **Proportion**  The proportion of courtship time spent by 84 females with the yellow-sword males
- **Pair**  Factor variable with 6 levels—"Pair 1", "Pair 2", "Pair 3", "Pair 4", "Pair 5" and "Pair 6"
- **Length**  Body size of the males

**Source**

References

Examples

str(case0602)
boxplot(Proportion~Pair, case0602, ylab="Proportion")

#as in Display 6.5
summary(aov(Proportion~Pair, case0602))

g/se.g

The Big Bang

Description

Hubble’s initial data on 24 nebulae outside the Milky Way.

Usage

case0701

Format

A data frame with 24 observations on the following 2 variables.

Velocity  recession velocity (in kilometres per second)
Distance  distance from earth (in magaparsec)

Source

References

\[ \text{plot(case0701)} \]

<table>
<thead>
<tr>
<th>case0702</th>
<th>Meat Processing and pH</th>
</tr>
</thead>
</table>

Description
A certain kind of meat processing may begin once the pH in postmortem muscle of a steer carcass has decreased sufficiently. To estimate the timepoint at which pH has dropped sufficiently, 10 steer carcasses were assigned to be measured for pH at one of five times after slaughter.

Usage
case0702

Format
A data frame with 10 observations on the following 2 variables.

- **Time**  time after slaughter (hours)
- **pH** pH level in postmortem muscle

Source

**case0801**  
*Island Area and Number of Species*

**Description**

The data are the numbers of reptile and amphibian species and the island areas for seven islands in the West Indies.

**Usage**

**case0801**

**Format**

A data frame with 7 observations on the following 2 variables.

- **Area**: area of island (in square miles)
- **Species**: number of reptile and amphibian species on island

**Source**

**Examples**

```
str(case0801)
plot(case0801)
```

---

**case0802**  
*Breakdown Times for Insulating Fluid under different Voltage*

**Description**

In an industrial laboratory, under uniform conditions, batches of electrical insulating fluid were subjected to constant voltages until the insulating property of the fluids broke down. Seven different voltage levels were studied and the measured responses were the times until breakdown.

**Usage**

**case0802**
Format
A data frame with 76 observations on the following 3 variables.

- Time  times until breakdown (in minutes)
- Voltage  voltage applied (in kV)
- Group  factor variable (group number)

Source

Examples

```r
str(case0802)
plot(log(Time)~Voltage, case0802)
```

---

Description
Meadowfoam is a small plant found growing in moist meadows of the US Pacific Northwest. Researchers reported the results from one study in a series designed to find out how to elevate meadowfoam production to a profitable crop. In a controlled growth chamber, they focused on the effects of two light–related factors: light intensity and the timing of the onset of the light treatment.

Usage
case0901

Format
A data frame with 24 observations on the following 3 variables.

- Flowers  average number of flowers per meadowfoam plant
- Time  time light intensity regimens started
- Intens  light intensity (in \(\mu\text{mol/m}^2/\text{sec}\))

Source

Examples

```r
str(case0901)
pplot(Flowers~Intens, case0901, pch= ifelse(Time=="Early", 19, 21))
```
Why Do Some Mammals Have Large Brains for Their Size?

Description

The data are the average values of brain weight, body weight, gestation lengths (length of pregnancy) and litter size for 96 species of mammals.

Usage

```r
case0902
```

Format

A data frame with 96 observations on the following 5 variables.

- `Species`: species
- `Brain`: average brain weight (in grams)
- `Body`: average body weight (in kilograms)
- `Gestation`: gestation period (in days)
- `Litter`: average litter size

Source

See Also

```r
case0902
```

Examples

```r
str(case0902)
pairs(log(Brain)-log(Body)+log(Litter)+Gestation, case0902)
```
**Description**

In 1609 Galileo proved mathematically that the trajectory of a body falling with a horizontal velocity component is a parabola. His search for an experimental setting in which horizontal motion was not affected appreciably (to study inertia) let him to construct a certain apparatus. The data comes from one of his experiments.

**Usage**

```
case1001
```

**Format**

A data frame with 7 observations on the following 2 variables.

- **Distance**: horizontal distances (in punti)
- **Height**: initial height (in punti)

**Source**

**Examples**

```
str(case1001)
plot(Distance ~ Height, case1001)
```

---

**Description**

The data are on in–flight energy expenditure and body mass from 20 energy studies on three types of flying vertebrates: echolocating bats, non–echolocating bats and non–echolocating birds.

**Usage**

```
case1002
```
Format

A data frame with 20 observations on the following 4 variables.

Species  
Mass  
Type  
Energy

Source

References

Examples

```r
str(case1002)

plot(log(Energy)~log(Mass), case1002,
     pch = ifelse(Type=="echolocating bats", 19,

       auto.key = list(x = 0.2, y = 0.9, corner = c(0, 1), border = TRUE))
```
Description

These data were collected on 18 women and 14 men to investigate a certain theory on why women exhibit a lower tolerance for alcohol and develop alcohol-related liver disease more readily than men.

Usage

case1101

Format

A data frame with 32 observations on the following 5 variables.

Subject subject number in the study
Metabol first-pass metabolism of alcohol in the stomach (in mmol/liter-hour)
Gastric gastric alcohol dehydrogenase activity in the stomach (in \( \mu \)mol/min/g of tissue)
Sex sex of the subject
Alcohol whether the subject is alcoholic or not

Source

Examples

```r
str(case1101)

```
The Blood–Brain Barrier

Description

The human brain is protected from bacteria and toxins, which course through the blood–stream, by a single layer of cells called the blood–brain barrier. These data come from an experiment (on rats, which process a similar barrier) to study a method of disrupting the barrier by infusing a solution of concentrated sugars.

Usage
case1102

Format

A data frame with 34 observations on the following 9 variables.

Brain Brain tumor count (per gm)
Liver Liver count (per gm)
Time Sacrifice time (in hours)
Treat Treatment received
Days Days post inoculation
Sex Sex of the rat
Weight Initial weight (in grams)
Loss Weight loss (in grams)
Tumor Tumor weight (in 10^{-4} grams)

Source

Examples

str(case1102)

plot(Brain/Liver ~ Time, case1102, log="xy", pch=ifelse(Treat=="BD", 19,21))
legend(10,0.1, pch=c(19,21), c("Saline control", "Barrier disruption"))
State Average SAT Scores

Description

Data on the average SAT scores for US states in 1982 and possible associated factors.

Usage

case1201

Format

A data frame with 50 observations on the following 8 variables.

State  US state

SAT  state averages of the total SAT (verbal + quantitative) scores

Takers  the percentage of the total eligible students (high school seniors) in the state who took the exam

Income  the median income of families of test–takers (in hundreds of dollars)

Years  the average number of years that the test–takers had formal studies in social sciences, natural sciences and humanities

Public  the percentage of the test–takers who attended public secondary schools

Expend  the total state expenditure on secondary schools (in hundreds of dollars per student)

Rank  the median percentile ranking of the test–takers within their secondary school classes

Source

Examples

str(case1201)
pairs(SAT~Rank+Years+Income+Public+Expend, case1201)
Sex discrimination in Employment

Description

Data on employees from one job category (skilled, entry–level clerical) of a bank that was sued for sex discrimination. The data are on 32 male and 61 female employees, hired between 1965 and 1975.

Usage

\texttt{case1202}

Format

A data frame with 93 observations on the following 7 variables.

- \texttt{Bsal}  Annual salary at time of hire
- \texttt{Sal77} Salary as of March 1975
- \texttt{Sex}  Sex of employee
- \texttt{Senior} Seniority (months since first hired)
- \texttt{Age}  Age of employee (in months)
- \texttt{Educ} Education (in years)
- \texttt{Exper} Work experience prior to employment with the bank (months)

str(case1202)
pairs(Sal77~Bsal+Senior+Age+Exper, case1202)
\end{verbatim}
Description

To study the influence of ocean grazers on regeneration rates of seaweed in the intertidal zone, a researcher scraped rock plots free of seaweed and observed the degree of regeneration when certain types of seaweed-grazing animals were denied access. The grazers were limpets (L), small fishes (f) and large fishes (F). Each plot received one of six treatments named by which grazers were allowed access. In addition, the researcher applied the treatments in eight blocks of 12 plots each. Within each block she randomly assigned treatments to plots. The blocks covered a wide range of tidal conditions.

Usage

\texttt{case1301}

Format

A data frame with 96 observations on the following 3 variables.

\begin{itemize}
  \item \texttt{Cover} percent of regenerated seaweed cover
  \item \texttt{Block} a factor with levels "B1", "B2", "B3", "B4", "B5", "B6", "B7" and "B8"
  \item \texttt{Treat} a factor indicating treatment, with levels "C", "f", "fF", "L", "Lf" and "LfF"
\end{itemize}

case1302

**Pygmalion Effect**

**Description**

One company of soldiers in each of 10 platoons was assigned to a Pygmalion treatment group, with remaining companies in the platoon assigned to a control group. Leaders of the Pygmalion platoons were told their soldiers had done particularly well on a battery of tests which were, in fact, non-existent. In this randomised block experiment, platoons are experimental units, companies are blocks, and average Practical Specialty test score for soldiers in a platoon is the response. The researchers wished to see if the platoon response was affected by the artificially-induced expectations of the platoon leader.

**Usage**

case1302

**Format**

A data frame with 29 observations on the following 3 variables.

Company a factor indicating company identification, with levels "C1", "C2",..., "C10"

Treat a factor indicating treatment with two levels, "Pygmalion" and "Control"

Score average score on practical specialty test of all soldiers in the platoon

**Source**

Effect of Ozone, SO2 and Drought on Soybean Yield

Description

In a completely randomized design with a 2x3x5 factorial treatment structure, researchers randomly assigned one of 30 treatment combinations to open-topped growing chambers, in which two soybean cultivars were planted. The responses for each chamber were the yields of the two types of soybean.

Usage

case1402

Format

A data frame with 30 observations on the following 5 variables.

Stress  a factor indicating treatment, with two levels "Well-watered" and "Stressed"
SO2    a quantitative treatment with three levels 0, 0.02 and 0.06
O3     a quantitative treatment with five levels 0.02, 0.05, 0.07, 0.08 and 0.10
Forrest the yield of the Forrest cultivar of soybean (in kg/ha)
William the yield of the Williams cultivar of soybean (in kg/ha)

Source

### Global Warming

**Description**

The data are the temperatures (in degrees Celsius) averaged for the northern hemisphere over a full year, for years 1880 to 1987. The 108-year average temperature has been subtracted, so each observation is the temperature difference from the series average.

**Usage**

```r
case1502
```
Format

A data frame with 108 observations on the following 2 variables.

Year  year in which yearly average temperature was computed, from 1880 to 1987
Temp  northern hemisphere temperature minus the 108-year average (degrees Celsius)

Source

References

Examples

```r

```
```

Description

Researchers taught 18 monkeys to distinguish each of 100 pairs of objects, 20 pairs each at 16, 12, 8, 4, and 2 weeks prior to a treatment. After this training, they blocked access to the hippocampal formation in 11 of the monkeys. All monkeys were then tested on their ability to distinguish the objects. The five-dimensional response for each monkey is the number of correct objects distinguished among those taught at 16, 12, 8, 4, and 2 weeks prior to treatment.

Usage

```r
case1601
```
Format

A data frame with 18 observations on the following 7 variables.

```
### Description

Thirty couples participated in a study of love and marriage. Wives and husbands responded separately to four questions:

1. What is the level of passionate love you feel for your spouse?
2. What is the level of passionate love your spouse feels for you?
3. What is the level of compassionate love you feel for your spouse?
4. What is the level of compassionate love your spouse feels for you?

Each response was recorded on a five-point scale: 1=None, 2=Very Little, 3=Some, 4=A Great Deal and 5=A Tremendous Amount.

### Usage

- **case1702**

### Format

A data frame with 30 observations on the following 9 variables.

- **Couple**: couple identification number
- **Hps**: level of passionate love husband feels for spouse
- **Wps**: level of passionate love wife feels for spouse
- **Hcs**: level of compassionate love husband feels for spouse
- **Wcs**: level of compassionate love wife feels for spouse
- **Hpy**: level of passionate love husband perceives spouse to have for him
- **Wpy**: level of passionate love wife perceives spouse to have for her
- **Hcy**: level of compassionate love husband perceives spouse to have for him
- **Wcy**: level of compassionate love husband perceives spouse to have for her

description

Description

Lawyers collected data on convicted black murderers in the state of Georgia to see whether convicted black murderers whose victim was white were more likely to receive the death penalty than those whose victim was black, after accounting for aggravation level of the murder. They categorized murders into 6 progressively more serious types. Category 1 comprises barroom brawls, liquor-induced arguments, lovers’ quarrels, and similar crimes. Category 6 includes the most vicious, cruel, cold-blooded, unprompted crimes.

Usage

case1902

Format

A data frame with 12 observations on the following 4 variables.

Aggravation  the aggravation level of the crime, a factor with levels "1", "2", "3", "4", "5" and "6"
Victim  a factor indicating race of murder victim, with levels "White" and "Black"
Death number in the aggravation and victim category who received the death penalty
Nodeath number in the aggravation and victim category who did not receive the death penalty

**case2001**  
*Survival in the Donner Party*

**Description**
This data frame contains the ages and sexes of the adult (over 15 years) survivors and nonsurvivors of the Donner party.

**Usage**
case2001
Format

A data frame with 45 observations on the following 3 variables.

Age  Age of person
Sex  Sex of person
Status  Whether the person survived or died

Details

In 1846 the Donner and Reed families left Springfield, Illinois, for California by covered wagon. In July, the Donner Party, as it became known, reached Fort Bridger, Wyoming. There its leaders decided to attempt a new and untested rote to the Sacramento Valley. Having reached its full size of 87 people and 20 wagons, the party was delayed by a difficult crossing of the Wasatch Range and again in the crossing of the desert west of the Great Salt Lake. The group became stranded in the eastern Sierra Nevada mountains when the region was hit by heavy snows in late October. By the time the last survivor was rescued on April 21, 1847, 40 of the 87 members had died from famine and exposure to extreme cold.

**case2002**  
*Birdkeeping and Lung Cancer*

Description

A 1972–1981 health survey in The Hague, Netherlands, discovered an association between keeping pet birds and increased risk of lung cancer. To investigate birdkeeping as a risk factor, researchers conducted a *case–control* study of patients in 1985 at four hospitals in The Hague (population 450,000). They identified 49 cases of lung cancer among the patients who were registered with a general practice, who were age 65 or younger and who had resided in the city since 1965. They also selected 98 controls from a population of residents having the same general age structure.
Usage
case2002

Format
A data frame with 147 observations on the following 7 variables.
LC  Whether subject has lung cancer
FM  Sex of subject
SS  Socioeconomic status, determined by occupation of the household’s principal wage earner
BK  Indicator for birdkeeping (caged birds in the home for more that 6 consecutive months from 5 to 14 years before diagnosis (cases) or examination (control))
AG  Age of subject (in years)
YR  Years of smoking prior to diagnosis or examination
CD  Average rate of smoking (in cigarettes per day)

Island Size and Bird Extinctions

Description
In a study of the Krunnit Islands archipelago, researchers presented results of extensive bird surveys taken over four decades. They visited each island several times, cataloguing species. If a species was found on a specific island in 1949, it was considered to be at risk of extinction for the next survey of the island in 1959. If it was not found in 1959, it was counted as an “extinction”, even though it might reappear later. This data frame contains data on island size, number of species at risk to become extinct and number of extinctions.

Usage
case2101
**Format**

A data frame with 18 observations on the following 4 variables.

- **Island**  Name of Island
- **Area**  Area of Island
- **Atrisk**  Number of species at risk
- **Extinct**  Number of extinctions

**Details**

Scientists agree that preserving certain habitats in their natural states is necessary to slow the accelerating rate of species extinctions. But they are divided on how to construct such reserves. Given a finite amount of available land, is it better to have many small reserves or a few large one? Central to the debate on this question are observational studies of what has happened in island archipelagos, where nearly the same fauna tries to survive on islands of different sizes.

---

**Description**

This data was collected by J.A. Bishop. Bishop selected seven locations progressively farther from Liverpool. At each location, Bishop chose eight trees at random. Equal number of dead (frozen) light (*Typicals*) and dark (*Carbonaria*) moths were glued to the trunks in lifelike positions. After 24 hours, a count was taken of the numbers of each morph that had been removed—presumably by predators.

**Usage**

```r
case2102
```
Format

A data frame with 14 observations on the following 4 variables.

- Morph: Morph, a factor with levels "light" and "dark"
- Distance: Distance from Liverpool (in km)
- Placed: Number of moths placed
- Removed: Number of moths removed

Details

Population geneticists consider clines particularly favourable situations for investigating evolutionary phenomena. A cline is a region where two colour morphs of one species arrange themselves at opposite ends of an environmental gradient, with increasing mixtures occurring between. Such a cline exists near Liverpool, England, where a dark morph of a local moth has flourished in response to the blackening of tree trunks by air pollution from the mills. The moths are nocturnal, resting during the day on tree trunks, where their coloration acts as camouflage against predatory birds. In Liverpool, where tree trunks are blackened by smoke, a high percentage of the moths are of the dark morph. One encounters a higher percentage of the typical (pepper-and-salt) morph as one travels from the city into the Welsh countryside, where tree trunks are lighter. J.A. Bishop used this cline to study the intensity of natural selection.

case2201 Age and Mating Success of Male Elephants

Description

Although male elephants are capable of reproducing by 14 to 17 years of age, your adult males are usually unsuccessful in competing with their larger elders for the attention of receptive females. Since male elephants continue to grow throughout their lifetimes, and since larger males tend to be more successful at mating, the males most likely to pass their genes to future generations are those whose characteristics enable them to live long lives. Joyce Poole studied a population of African elephants in Amboseli National Park, Kenya, for 8 years. This data frame contains the number of successful matings and ages (at the study’s beginning) of 41 male elephants.
Usage

case2201

Format

A data frame with 41 observations on the following 2 variables.

- **Age**: Age of elephant at beginning of study
- **Matings**: Number of successful matings

**Characteristics Associated with Salamander Habitat**

**Description**

The Del Norte Salamander (*plethodon elongates*) is a small (5–7 cm) salamander found among rock rubble, rock outcrops and moss-covered talus in a narrow range of northwest California. To study the habitat characteristics of the species and particularly the tendency of these salamanders to reside in dwindling old-growth forests, researchers selected 47 sites from plausible salamander habitat in national forest and parkland. Randomly chosen grid points were searched for the presence of a site with suitable rocky habitat. At each suitable site, a 7 metre by 7 metre search area was examined for the number of salamanders it contained. This data frame contains the counts of salamanders at the sites, along with the percentage of forest canopy and age of the forest in years.

Usage

```r
case2202
```
Format

A data frame with 47 observations on the following 4 variables.

Site Investigated site
Salaman Number of salamanders found in 49 m$^2$ area
PctCover Percentage of canopy cover
Forestage Forest age

Bumpus’s Data on Natural Selection (Weight)

Description
As evidence in support of natural selection, Bumpus presented measurements on house sparrows brought to the Anatomical Laboratory of Brown University after an uncommonly severe winter storm. Some of these birds had survived and some had perished. Bumpus asked whether those that perished did so because they lacked physical characteristics enabling them to withstand the intensity of that particular instance of selective elimination. The data are on the the weights, in grams, for the 24 adult male sparrows that perished and for the 35 adult males that survived.
Usage

ex0221

Format

A data frame with 59 observations on the following 2 variables.

- **Weight**: weight of adult male sparrows (in grams)
- **Status**: factor variable indicating whether the sparrow perished or survived in a winter storm

Male Displays

Description

Black wheatears are small birds in Spain and Morocco. Males of the species demonstrate an exaggerated sexual display by carrying many heavy stones to nesting cavities. This 35-gram bird transports, on average, 3.1 kg of stones per nesting season! Different males carry somewhat different sized stones, prompting a study on whether larger stones may be a signal of higher health status. Soler et al. calculated the average stone mass (g) carried by each of 21 male black wheatears, along with T-cell response measurements reflecting their immune systems’ strengths.

Usage

ex0729
Format

A data frame with 21 observations on the following 2 variables.

- Mass: average mass of stones carried by bird (in g)
- Tcell: T-cell response measurement (in mm)

**Brain Activity in Violin and String Players**

Description

Studies over the past two decades have shown that activity can effect the reorganisation of the human central nervous system. For example, it is known that the part of the brain associated with activity of a finger or limb is taken over for other purposes in individuals whose limb or finger has been lost. In one study, psychologists used magnetic source imaging (MSI) to measure neuronal activity in the brains of nine string players (six violinists, two cellists and one guitarist) and six controls who had never played a musical instrument, when the thumb and fifth finger of the left hand were exposed to mild stimulation. The researchers felt that stringed instrument players, who use the fingers of their left hand extensively, might show different behaviour—as a result of this extensive physical activity—than individuals who did not play stringed instruments.

Usage

```r
ex0730
```

Format

A data frame with 15 observations on the following 2 variables.

Description

The data are observations on the difference between Democratic and Republican vote counts, by (a) absentee ballot and (b) voting machine, for 21 elections in Philadelphia’s senatorial districts over the last 10 years.

Usage

ex0820

Format

A data frame with 21 observations on the following 2 variables.

Absentee  Democratic minus Republican vote count by absentee ballot
Machines  Democratic minus Republican vote count by voting machine

Details

In a special election to fill a Pennsylvania State Senate seat in 1993, the Democrat, William Stinson, received 19,127 machine–counted votes and the Republican, Bruce Marks, received 19,691. In addition, there were 1,391 absentee ballots for Stinson and 366 absentee ballots for Marks, so that the total tally showed Stinson the winner by 461 votes. The large disparity between the machine–counted and absentee votes, and the resulting reversal of the outcome due to the absentee ballots caused some concern about possible illegal influence on the absentee votes. To see whether the discrepancy in absentee votes was larger than could be explained by chance, an econometrician considered the data given in this data frame (read from a graph in *The New York Times*, 11 April 1994).

ex1027     Factors Affecting Extinction
---------

Description

Data are measurements on breeding pairs of land-bird species collected from 16 islands around Britain over the course of several decades. For each species, the data set contains an average time of extinction on those islands where it appeared, the average number of nesting pairs, the size of the species and the migratory status of the species.

Usage

ex1027
Format

A data frame with 62 observations on the following 5 variables.

Species  a character vector indicating the species
Time    average extinction time in years
Pairs   average number of nesting pairs
Size    a factor with levels "L" and "S"
Status  a factor with levels "M" and "R"

Source

Description

Data set with the numbers of Atlantic Basin tropical storms and hurricanes for each year from 1950–1997. The variable storm index is an index of overall intensity of hurricane season. Also listed are whether the year was a cold, warm or neutral El Nino year and a variable indicating whether West Africa was wet or dry that year.

Usage

ex1028

Format

A data frame with 48 observations on the following 7 variables.

Year  year
ElNino a factor with levels "cold", "neutral" and "warm"
Temperature numeric variable with values -1 if ElNino is "cold", 0 if "neutral" and 1 if "warm"
WestAfrica numeric variable indicating whether West Africa was wet (1) or dry (0)
Storms number of storms
Hurricanes number of hurricanes
StormIndex index of overall intensity of hurricane season

---

Description

Complete data set for problem introduced in *ex1123*. Data from early study designed to explore the relationship between air pollution and mortality.

Usage

ex1217

Format

A data frame with 60 observations on the following 17 variables.

City  a character vector indicating the city
Mort  total age-adjusted mortality from all causes
Precip  mean annual precipitation (inches)
Humidity  percent relative humidity (annual average at 1:00pm)
Jantemp  mean January temperature (degrees F)
Julytemp  mean July temperature (degrees F)
Over65  percentage of the population aged 65 years or over
House  population per household
Educ   median number of school years completed for persons 25 years or older
Sound percentage of the housing that is sound with all facilities
Density population density (in persons per square mile of urbanized area)
Nonwhite percentage of population that is nonwhite
Whitecoll percentage of employment in white collar occupations
Poor   percentage of households with annual income under $3,000 in 1960
HC     relative pollution potential of hydrocarbons
NOx    relative pollution potential of oxides of nitrogen
S02    relative pollution potential of sulfur dioxide

**Description**

The rise in abundance of algae in coastal waters is thought to be due to increases in nutrients such as nitrate and other forms of nitrogen. Researchers gathered data to gauge the evidence that nitrates in the discharges of rivers around the world are associated with human population density.

**Usage**

```r
ex1221
```
### Format

A data frame with 42 observations on the following 11 variables.

- **River**: a character vector indicating the river
- **Country**: a factor variable with 26 levels
- **Discharge**: the estimated annual average discharge of the river into an ocean (m$^3$ per second)
- **Runoff**: estimated annual average runoff from the watershed (liters/(sec × km$^2$))
- **Area**: watershed area (km$^2$)
- **Density**: density of people (people/km$^2$)
- **NO3**: nitrate concentration (µM/l)
- **Export**: nitrate export (product of runoff times nitrate concentration)
- **Dep**: deposition (proportional to product of nitrate precipitation times precipitation)
- **NPrec**: nitrate precipitation (µmol NO$_3$/(sec × km$^2$))
- **Prec**: precipitation (cm/year)

Dinosaur Extinctions—An Observational Study

Description

About 65 million years ago, the dinosaurs suffered a mass extinction virtually overnight (in geologic time). Among many clues, one that all scientists regard as crucial is a layer of iridium-rich dust that was deposited over much of the earth at that time. The theory is that an event like a volcanic eruption or meteor impact caused a massive dust cloud that blanketed the earth for years killing off animals and their food sources. Dataset has Iridium depths by type of deposit.

Usage

ex1317
**Format**

A data frame with 28 observations on the following 3 variables.

- **Iridium**  Iridium in samples (ppt)
- **Strata**   a factor with levels "Limestone" and "Shale"
- **Depth**   a factor with six levels: "1", "2", ..., "6"

Description

Recent studies in the field of psychoimmunology suggest a link exists between behavioral events and the functioning of one’s immune system. Data shows the results of a study on 12 subjects who were monitored during three distinct activities. The first activity consisted of neutral activity such as reporting tasks. During the second activity, subjects listened to audiotape exercises relating to images of heaviness, warmth in the body, relaxation, suggestions to remember happy events, etc. The third activity included a nonaudio tape follow up stimulus consisting of continued relaxation as in activity 2 and a verbal discussion of the positive aspects of the audiotape.

Usage

ex1614

Format

A data frame with 12 observations on the following 3 variables.

PhaseA  Interleukin-1 levels (counts per minute) from blood samples taken during activity A
PhaseB  Interleukin-1 levels (counts per minute) from blood samples taken during activity B
PhaseC  Interleukin-1 levels (counts per minute) from blood samples taken during activity C

**Vitamin C and Colds**

**Description**

Fictitious data set based on results of an experiment where subjects were randomly divided into two groups and given a placebo or vitamin C to take during the cold season. At the end of the cold season, the subjects were interviewed by a physician who determined whether they had or had not suffered a cold during the period. Skeptics interviewed the 800 subjects to determine who knew and who did not know to which group they had been assigned. Vitamin C has a bitter taste and those familiar with it could recognize whether their pills contained it.

**Usage**

ex1916

**Format**

A data frame with 4 observations on the following 4 variables.

- **Knew** a factor with levels "no" and "yes"
- **Treatment** a factor with levels "placebo" and "vitC"
- **Cold** number of people who got a cold
- **NoCold** number of people who did not get a cold

**Alcohol Consumption and Breast Cancer—A Retrospective Study**

**Description**

Dataset from a study which investigated the added risk of breast cancer due to alcohol consumption. A sample of confirmed breast cancer patients were compared with a sample of cancer free women who were close in age and from the same neighborhood as the cases. Data was collected on the alcohol consumption and body mass of both sets of women.
Usage

ex1917

Format

A data frame with 6 observations on the following 4 variables.

- **Bodymass**: a factor with levels "high", "low" and "medium"
- **Drinking**: a factor with levels "high" and "low"
- **Cases**: number of women with breast cancer
- **Controls**: number of women without breast cancer

Description

Duchenne Muscular Dystrophy (DMD) is a genetically transmitted disease, passed from a mother to her children. Boys with the disease usually die at a young age; but affected girls usually do not suffer symptoms, may unknowingly carry the disease and may pass it to their offspring. It is believed that about 1 in 3,300 women are DMD carriers. A woman might suspect she is a carrier when a related male child develops the disease. Doctors must rely on some kind of test to detect the presence of the disease. This data frame contains data on two enzymes in the blood, creatine kinase (CK) and hemopexin (H) for 38 known DMD carriers and 82 women who are not carriers. It is desired to use these data to obtain an equation for indicating whether a women is a likely carrier.

Usage

ex2012

Format

A data frame with 120 observations on the following 3 variables.

Group  Indicator whether the woman has DMD ("Case") or not ("Control")
CK    Creatine kinase reading
H     Hemopexin reading

Description

Hermon Bumpus analysed various characteristics of some house sparrows that were found on the ground after a severe winter storm in 1898. Some of the sparrows survived and some perished. This data set contains the survival status, age, the length from tip of beak to tip of tail (in mm), the alar extent (length from tip to tip of the extended wings, in mm), the weight in grams, the length of the head in mm, the length of the humerus (arm bone, in inches), the length of the femur (thigh bones, in inches), the length of the tibio–tarsus (leg bone, in inches), the breadth of the skull in inches and the length of the sternum in inches.

Usage

ex2016

Format

A data frame with 87 observations on the following 11 variables.

Status  Survival status, factor with levels "Perished" and "Survived"
AG  Age, factor with levels "adult" and "juvenile"
TL  total length (in mm)
AE  alar extent (in mm)
WT  weight (in grams)
BH  length of beak and head (in mm)
HL  length of humerus (in inches)
FL  length of femur (in inches)
TT  length of tibio–tarsus (in inches)
SK  width of skull (in inches)
KL  length of keel of sternum (in inches)

Description

This data frame contains data on 1995 and later model compact sports utility vehicles involved in fatal accidents in the United States between 1995 and 1999, excluding those that were struck by another car and excluding accidents that, according to police reports, involved alcohol.

Usage

ex2018

Format

A data frame with 2321 observations on the following 4 variables.

Make      Type of sports utility vehicle, factor with levels "Other" and "Ford"
Vehicle.age Vehicle age (in years); surrogate for age of tires
Passengers Number of passengers
Cause     Cause of fatal accident, factor with levels "Not_Tire" and "Tire"

Details

The Ford Explorer is a popular sports utility vehicle made in the United States and sold throughout the world. Early in its production concern arose over a potential accident risk associated with tires of the prescribed size when the vehicle was carrying heavy loads, but the risk was thought to be acceptable if a low tire pressure was recommended. The problem was apparently exacerbated by a particular type of Firestone tire that was overly prone to separation, especially in warm temperatures. This type of tire was a common one used on Explorers in model years 1995 and later. By the end of 1999 more than 30 lawsuits had been filed over accidents that were thought to be associated with this problem. U.S. federal data on fatal car accidents were analysed at that time, showing that the odds of a fatal accident being associated with tire failure were three times as great for Explorers as for other sports utility vehicles.

Additional data from 1999 and additional variables may be used to further explore the odds ratio. It is of interest to see whether the odds that a fatal accident is tire-related depend on whether the vehicle is a Ford, after accounting for age of the car and number of passengers. Since the Ford tire problem may be due to the load carried, there is some interest in seeing whether the odds associated with a Ford depend on the number of passengers.

Belief Accessibility

Description

The study the effect of context questions prior to target questions, researchers conducted a poll involving 1,054 subjects selected randomly from the Chicago phone directory. To include possibly unlisted phones, selected numbers were randomly altered in the last position. This data frame contains the responses to one of the questions asked concerning continuing U.S. aid to the Nicaraguan Contra rebels. Eight different versions of the interview were given, representing all possible combinations of three factors at each of two levels. The experimental factors were Context, Mode and Level.

Context refers to the type of context questions preceding the question about Nicaraguan aid. Some subjects received a context question about Vietnam, designed to elicit reticence about having the U.S. become involved in another foreign war in a third–world country. The other context question was about Cuba, designed to elicit anti–communist sentiments.

Mode refers to whether the target question immediately followed the context question or whether there were other questions scattered in between.

Level refers to two versions of the context question. In the "high" level the question was worded to elicit a higher level of agreement than in the "low" level wording.

Usage

\texttt{ex2115}

Format

A data frame with 8 observations on the following 5 variables.

\begin{verbatim}
  Context  Factor referring to the context of the question preceding the target question about U.S. aid to the Nicaraguan Contra rebels
  Mode    Factor with levels "not" and "scattered", "scattered" is used if the target question was not asked directly after the context question
  Level   Factor with levels "low" and "high", refers to the wording of the question
  M       Number of people interviewed
  Percent Percentage in favour of Contra aid
\end{verbatim}
Details
Increasingly, politicians look to public opinion surveys to shape their public stances. Does this represent the ultimate in democracy? Or are seemingly scientific polls being rigged by the manner of questioning? Psychologists believe that opinions—expressed as answers to questions—are usually generated at the time the question is asked. Answers are based on a quick sampling of relevant beliefs held by the subject, rather than a systematic canvas of all such beliefs. Furthermore, this sampling of beliefs tends to overrepresent whatever beliefs happen to be most accessible at the time the question is asked. This aspect of delivering opinions can be abused by the pollster. Here, for example, is one sequence of questions:

1. “Do you believe the Bill of Rights protects personal freedom?”
2. “Are you in favor of a ban on handguns?”

Here is another:

1. “Do you think something should be done to reduce violent crime?”
2. “Are you in favor of a ban on handguns?”

The proportion of yes answers to question 2 may be quite different depending on which question 1 is asked first.

Aflatoxicol and Liver Tumors in Trout

Description
An experiment at the Marine/Freshwater Biomedical Sciences Center at Oregon State University investigated the carcinogenic effects of aflatoxicol, a metabolite of Aflatoxin B1, which is a toxic by-product produced by a mold that infects cottonseed meal, peanuts and grains. Twenty tanks of rainbow trout embryos were exposed to one of five doses of Aflatoxicol for one hour. The data represent the numbers of fish in each tank and the numbers of these that had liver tumours after one year.
Usage

ex2116

Format

A data frame with 20 observations on the following 3 variables.

Dose  Dose (in ppm)
Tumor  Number of trout with liver tumours
Total  Number of trout in tank

Effect of Stress During Conception on Odds of a Male Birth

Description

The probability of a male birth in humans is about .51. It has previously been noticed that lower proportions of male births are observed when offspring is conceived at times of exposure to smog, floods or earthquakes. Danish researchers hypothesised that sources of stress associated with severe life events may also have some bearing on the sex ratio. To investigate this theory they obtained the sexes of all 3,072 children who were born in Denmark between 1 January 1980 and 31 December 1992 to women who experienced the following kind of severe life events in the year of the birth or the year prior to the birth: death or admission to hospital for cancer or heart attack of their partner or of their other children. They also obtained sexes on a sample of 20,337 births to mothers who did not experience these life stress episodes. This data frame contains the data that were collected. Noticed that for one group the exposure is listed as taking place during the first trimester of pregnancy. The rationale for this is that the stress associated with the cancer or heart attack of a family member may well have started before the recorded time of death or hospital admission.

Usage

ex2117
Format

A data frame with 5 observations on the following 4 variables.

- **Group**: Indicator for groups to which mothers belong
- **Time**: Indicator for time at which severe life event occurred
- **Number**: Number of births
- **PctBoys**: Percentage of boys born

**Description**

Researchers in Kenya identified a cohort of more than 1,000 prostitutes who were known to be a major reservoir of sexually transmitted diseases in 1985. It was determined that more than 85% of them were infected with human immunodeficiency virus (HIV) in February, 1986. The researchers identified men who acquired a sexually-transmitted disease from this group of women after the men sought treatment at a free clinic. The data frame contains data on the subset of those men who did not test positive for HIV on their first visit and who agreed to participate in the study. The men are categorised according to whether they later tested positive for HIV during the study period, whether they had one or multiple sexual contacts with the prostitutes and whether they were circumcised.

**Usage**

```r
ex2118
```
Format

A data frame with 4 observations on the following 5 variables.

Contact Whether men had single or multiple contact with prostitutes
Circumcised Whether the men are circumcised, factor with levels "no" and "yes"
HIV Number of men that tested positive for HIV
Number Number of men
NoHIV Number of men that did not test positive for HIV (should be Number-HIV)

ex2119  *Meta–Analysis of Breast Cancer and Lactation Studies*

Description

This data frame gives the results of 10 separate case–control studies on the association of breast cancer and whether a woman had breast–fed children.

Usage

ex2119

Format

A data frame with 20 observations on the following 4 variables.

Study Factor indicating the study from which data was taken
Lactate Whether women had breast–fed children (lactated)
Cancer Number of women with breast cancer
NoCancer Number of women without breast cancer
Details

Meta-analysis refers to the analysis of analyses. When the main results of studies can be cast into $2 \times 2$ tables of counts, it is natural to combine individual odds ratios with a logistic regression model that includes a factor to account for different odds from the different studies. In addition, the odds ratio itself might differ slightly among studies because of different effects on different populations or different research techniques. One approach for dealing with this is to suppose an underlying common odds ratio and to model between-study variability as extra-binomial variation.

*Cancer Death of Atomic Bomb Survivors*

Description

The data in this data frame are the number of cancer deaths among survivors of the atomic bombs dropped on Japan during World War II, categorised by time (years) after the bomb that death occurred and the amount of radiation exposure that the survivors received from the blast (Data from D.A. Pierce, personal communication.) Also listed in each cell is the *person-years at risk*, in 100s. This is the sum total of all years spent by all persons in the category.

Usage

```r
ex22.20
```

Format

A data frame with 42 observations on the following 4 variables.

- **Exposure**: Estimated exposure to radiation (in rads)
- **Years**: Years after exposure, factor with 7 levels
- **Deaths**: Number of cancer deaths
- **Risk**: Person-years at risk (in 100s)
Murder–Suicides by Deliberate Plane Crash

Some sociologist suspect that highly publicised suicides may trigger additional suicides. In one investigation of this hypothesis, D.P. Phillips collected information about 17 airplane crashes that were known (because of notes left behind) to be murder–suicides. For each of these crashes, Phillips reported an index of the news coverage (circulation of nine newspapers devoting space to the crash multiplied by length of coverage) and the number of multiple-fatality plane crashes during the week following the publicised crash. This data frame contains the collected data.
Emulating Jane Austen’s Writing Style

Description

When she died in 1817, the English novelist Jane Austen had not yet finished the novel Sanditon, but she did leave notes on how she intended to conclude the book. The novel was completed by a ghost writer, who attempted to emulate Austen’s style. In 1978, a researcher reported counts of some words found in chapters of books written by Austen and in chapters written by the emulator. These data are given in this data frame.

Usage

ex2222

Format

A data frame with 24 observations on the following 3 variables.

Count  Number of occurrences of a word in various chapters of books written by Jane Austen and the ghost writer
Book   Title of books used
Word   Words used
