Package ‘baseline’

October 12, 2022

Encoding UTF-8
Type Package
Title Baseline Correction of Spectra
Version 1.3-4
Date 2022-07-06
Maintainer Kristian Hovde Liland <kristian.liland@nmbu.no>
Description Collection of baseline correction algorithms, along with a framework and a Tcl/Tk enabled GUI for optimising baseline algorithm parameters. Typical use of the package is for removing background effects from spectra originating from various types of spectroscopy and spectrometry, possibly optimizing this with regard to regression or classification results. Correction methods include polynomial fitting, weighted local smoothers and many more.

Description

A common framework with implementations of several baseline correction methods

Details

Package: baseline
Type: Package
Version: 1.2-2
Date: 2019-11-05
License: GPL-2

Use function baseline for baseline correction. This function takes matrices of spectra, a method name and parameters needed for the specific method. See helpfiles for details.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik
Maintainer: Kristian Hovde Liland <kristian.liland@nmbu.no>

## Extraction methods for "baselineAlgTest" objects

### Description
Extraction methods specifically for objects of class `baselineAlgTest`

### Usage
```r
algorithm(object)
eextraArgs(object)
```

### Arguments
- **object**: Object of class `baselineAlgTest`

### Value
The corresponding slot

Baseline correction

Description

Common framework for baseline correction

Usage

baseline(spectra, method = "irls", ...)

Arguments

• spectra       Matrix with spectra in rows
• method        Baseline correction method
• ...           Additional parameters, sent to the method

Details

Estimates baselines for the spectra, using the algorithm named in method.

Value

An object of class baseline.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

baseline-class

Class "baseline"

Description

Stores the result of estimating baselines for one or more spectra.

Objects from the Class

The normal way to create objects is with the function `baseline`. Several baseline algorithms are available. See `baseline` for details. There is a plot method for the class; see `plot, baseline-class`.
baseline.als

Slots

- **baseline**: A matrix with the estimated baselines
- **corrected**: A matrix with the corrected spectra
- **spectra**: A matrix with the original spectra
- **call**: The call to `baseline`

Methods

- **getBaseline** signature(object = "baseline"): Extract the estimated baselines
- **getCall** signature(object = "baseline"): Extract the call to `baseline` used to create the object
- **getCorrected** signature(object = "baseline"): Extract the corrected spectra
- **getSpectra** signature(object = "baseline"): Extract the original spectra

Warning

In a future version, one of the slots might be removed from the class definition and calculated on the fly instead, in order to save space. Therefore, do use the extractor functions (getSpectra, getBaseline and getCorrected) instead of accessing the slots directly.

Author(s)

- Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

- `baseline, getBaseline, getSpectra, getCorrected, getCall`

Examples

```r
showClass("baseline")
```

Description

Baseline correction by 2nd derivative constrained weighted regression. Original algorithm proposed by Paul H. C. Eilers and Hans F.M. Boelens

Usage

```r
baseline.als(spectra, lambda = 6, p = 0.05, maxit = 20)
```
baseline.fillPeaks

Argument

- spectra: Matrix with spectra in rows
- lambda: 2nd derivative constraint
- p: Weighting of positive residuals
- maxit: Maximum number of iterations

Details

Iterative algorithm applying 2nd derivative constraints. Weights from previous iteration is p for positive residuals and 1−p for negative residuals.

Value

- baseline: Matrix of baselines corresponding to spectra spectra
- corrected: Matrix of baseline corrected spectra
- wgts: Matrix of final regression weights

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Examples

data(milk)
bc.als <- baseline(milk$spectra[1,, drop=FALSE], lambda=10, method='als')
## Not run:
plot(bc.als)
## End(Not run)

baseline.fillPeaks  Fill peaks

Description

An iterative algorithm using suppression of baseline by means in local windows

Usage

baseline.fillPeaks(spectra, lambda, hwi, it, int)
baseline.irls

Arguments
spectra       Matrix with spectra in rows
lambda        2nd derivative penalty for primary smoothing
hwi           Half width of local windows
it            Number of iterations in suppression loop
int           Number of buckets to divide spectra into

Details
In local windows of buckets the minimum of the mean and the previous iteration is chosen as the new baseline

Value
baseline       Matrix of baselines corresponding to spectra spectra
corrected      Matrix of baseline corrected spectra

Author(s)
Kristian Hovde Liland and Bjørn-Helge Mevik

References
Kristian Hovde Liland, 4S Peak Filling - baseline estimation by iterative mean suppression, MethodsX 2015

Examples
data(milk)
bcc.fillPeaks <- baseline(milk$spectra[1,, drop=FALSE], lambda=6,
hwi=50, it=10, int=2000, method='fillPeaks')
## Not run:
plot(bc.fillPeaks)
## End(Not run)

Description
An algorithm with primary smoothing and repeated baseline suppressions and regressions with 2nd derivative constraint

Usage
baseline.irls(spectra, lambda1 = 5, lambda2 = 9, maxit = 200, wi = 0.05)
Arguments

spectra Matrix with spectra in rows
lambda1 2nd derivative constraint for primary smoothing
lambda2 2nd derivative constraint for secondary smoothing
maxit Maximum number of iterations
wi Weighting of positive residuals

Value

baseline Matrix of baselines corresponding to spectra spectra
corrected Matrix of baseline corrected spectra
smoothed Matrix of primary smoothed spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

Examples

data(milk)
b.c.irls <- baseline(milk$spectra[1,, drop=FALSE], method='irls')
## Not run:
plot(bc.irls)
## End(Not run)

baseline.lowpass Low-pass FFT filter

Description

An algorithm for removing baselines based on Fast Fourier Transform filtering

Usage

baseline.lowpass(spectra, steep = 2, half = 5)

Arguments

spectra Matrix with spectra in rows
steep Steepness of filter curve
half Half-way point of filter curve

Details

Since the scale of the spectra will be different after filtering, baselines will not be returned by the algorithm.
baseline.medianWindow

Value

- baseline: Matrix of baselines corresponding to spectra
- corrected: Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

AHMET K. ATAKAN, W. E. BLASS, and D. E. JENNINGS: Elimination of Baseline Variations from a Recorded Spectrum by Ultra-low Frequency Filtering

Examples

data(milk)
bcl.lowpass <- baseline(milk$spectra[1,, drop=FALSE], method='lowpass')
## Not run:
plot(bc.lowpass)
## End(Not run)

baseline.medianWindow  Median window

Description

An implementation and extension of Mark S. Friedrichs’ model-free algorithm

Usage

baseline.medianWindow(spectra, hwm, hws, end)

Arguments

- spectra: Matrix with spectra in rows
- hwm: Window half width for local medians
- hws: Window half width for local smoothing (optional)
- end: Original endpoint handling (optional boolean)

Details

An algorithm finding medians in local windows and smoothing with gaussian weighting

Value

- baseline: Matrix of baselines corresponding to spectra
- corrected: Matrix of baseline corrected spectra

**Author(s)**

Kristian Hovde Liland and Bjørn-Helge Mevik

**References**

Mark S. Friedrichs: A model-free algorithm for the removal of baseline artifacts

**Examples**

```r
data(milk)
bc.medianWindow <- baseline(milk$spectra[,1,, drop=FALSE, hwm=300, method='medianWindow')
## Not run:
plot(bc.medianWindow)
## End(Not run)
```

**baseline.modpolyfit**  
*Modified polynomial fitting*

**Description**

An implementation of CHAD A. LIEBER and ANITA MAHADEVAN-JANSEn's algorithm for polynomial fitting

**Usage**

```r
baseline.modpolyfit(spectra, t, degree = 4, tol = 0.001, rep = 100)
```

**Arguments**

- `spectra`: Matrix with spectra in rows
- `t`: Optional vector of spectrum abcissa
- `degree`: Degree of polynomial
- `tol`: Tolerance of difference between iterations
- `rep`: Maximum number of iterations

**Details**

Polynomial fitting with baseline suppression relative to original spectrum

**Value**

- `baseline`: Matrix of baselines corresponding to spectra `spectra`
- `corrected`: Matrix of baseline corrected spectra
baseline.peakDetection

**Author(s)**

Kristian Hovde Liland and Bjørn-Helge Mevik

**References**

CHAD A. LIEBER and ANITA MAHADEVAN-JANSEN: Automated Method for Subtraction of Fluorescence from Biological Raman Spectra

**Examples**

```r
data(milk)
bcmodpolyfit <- baseline(milk$spectra[, , drop=FALSE], method='modpolyfit', deg=6)
## Not run:
plot(bcmodpolyfit)
## End(Not run)
```

**baseline.peakDetection**

*Simultaneous Peak Detection and Baseline Correction*

**Description**

A translation from Kevin R. Coombes et al.'s MATLAB code for detecting peaks and removing baselines

**Usage**

```r
baseline.peakDetection(spectra, left, right, lwin, rwin, snminimum, mono=0, multiplier=5, left.right, lwin.rwin)
```

**Arguments**

- `spectra` Matrix with spectra in rows
- `left` Smallest window size for peak widths
- `right` Largest window size for peak widths
- `lwin` Smallest window size for minimums and medians in peak removed spectra
- `rwin` Largest window size for minimums and medians in peak removed spectra
- `snminimum` Minimum signal to noise ratio for accepting peaks
- `mono` Monotonically decreasing baseline if mono>0
- `multiplier` Internal window size multiplier
- `left.right` Sets left and right to value of `left.right`
- `lwin.rwin` Sets `lwin` and `rwin` to value of `lwin.rwin`
Details

Peak detection is done in several steps sorting out real peaks through different criteria. Peaks are removed from spectra and minimums and medians are used to smooth the remaining parts of the spectra. If `snminimum` is omitted, `y3`, `midspec`, `y` and `y2` are not returned (faster)

Value

- `baseline`: Matrix of baselines corresponding to spectra
- `corrected`: Matrix of baseline corrected spectra
- `peaks`: Final list of selected peaks
- `sn`: List signal to noise ratios for peaks
- `y3`: List of peaks prior to signal to noise selection
- `midspec`: Mid-way baseline estimation
- `y`: First estimate of peaks
- `y2`: Second estimate of peaks

Author(s)

Examples

data(milk)
bc.peakDetection <- baseline(milk$spectra[1,, drop=FALSE], method='peakDetection',
left=300, right=300, lwin=50, rwin=50)
## Not run:
plot(bc.peakDetection)
## End(Not run)

Description

Wrapper for Andreas F. Ruckstuhl, Matthew P. Jacobson, Robert W. Field, James A. Dodd’s algorithm based on LOWESS and weighted regression
Usage

baseline.rfbaseline(spectra, span = 2/3, NoXP = NULL, maxit = c(2, 2),
         b = 3.5, weight = NULL, Scale = function(r) median(abs(r))/0.6745,
         delta = NULL, SORT = FALSE, DOT = FALSE, init = NULL)

Arguments

  spectra       Matrix with spectra in rows
  span          Amount of smoothing (by fraction of points)
  NoXP          Amount of smoothing (by number of points)
  maxit         Maximum number of iterations in robust fit
  b             Tuning constant in the biweight function
  weight        Optional weights to be given to individual observations
  Scale         S function specifying how to calculate the scale of the residuals
  delta         Nonnegative parameter which may be used to save computation. (See rfbaseline
                 SORT          Boolean variable indicating whether x data must be sorted.
  DOT           Disregard outliers totally (boolean)
  init          Values of initial fit

Details

Most of the code is the original code as given by the authors. The ability to sort by X-values has
been removed and ability to handle multiple spectra has been added

Value

  baseline      Matrix of baselines corresponding to spectra spectra
  corrected     Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

using robust local regression estimation

Examples

data(milk)
bc.rbe <- baseline(milk$spectra[, , drop=FALSE], method='rfbaseline',
         span=NULL, NoXP=1000)
## Not run:
plot(bc.rbe)
## End(Not run)
baseline.rollingBall  

*Rolling ball*

**Description**

Ideas from Rolling Ball algorithm for X-ray spectra by M.A.Kneen and H.J. Annegarn. Variable window width has been left out.

**Usage**

```r
baseline.rollingBall(spectra, wm, ws)
```

**Arguments**

- *spectra*: Matrix with spectra in rows
- *wm*: Width of local window for minimization/maximization
- *ws*: Width of local window for smoothing

**Value**

- *baseline*: Matrix of baselines corresponding to spectra *spectra*
- *corrected*: Matrix of baseline corrected spectra

**Author(s)**

**Examples**

```r
data(milk)
bcr.rollingBall <- baseline(milk$spectra[1,, drop=FALSE], wm=200, ws=200, method='rollingBall')
## Not run:
plot(bcr.rollingBall)
## End(Not run)
```
Description

Shirley Background correction for X-ray Photoelectron Spectroscopy.

Usage

baseline.shirley(spectra, t = NULL, limits = NULL, maxit = 50, err = 1e-6)

Arguments

- **spectra**: matrix with only 1 y-coordinates by rows (i.e.: \( y = \text{spectra}[1,] \))
- **t**: Optional vector of spectrum abscissa
- **limits**: list with the y coordinates between calculation of background. Usually these are the extreme point of the data range.
- **maxit**: max number of iteration
- **err**: Tolerance of difference between iterations

Details

The shape of the spectrum background or baseline is affected by inelastic energy loss processes, secondary electrons and nearby peaks. A reasonable approximation is essential for a qualitative and quantitative analysis of XPS data especially if several components interfere in one spectrum. The choice of an adequate background model is determined by the physical and chemical conditions of the measurements and the significance of the background to the information to be obtained. The subtraction of the baseline before entering the fit iterations or the calculation of the peak area can be an acceptable approximation for simple analytical problems. In order to obtain chemical and physical parameters in detail, however, it is absolutely necessary to include the background function in the iterative peak fit procedure. The primary function \( F(E) \) results from the experimentally obtained function \( M(E) \) and the background function \( U(E) \) as

\[
F(E) = M(E) - U(E)
\]

The kinetic energy \( E \) of the spectra can be described as

\[
E = SE + SW \times (i - 1)
\]

\( SE \) means the start energy in eV, \( SW \) is the step width in eV and \( i \) the channel number. \( i \) can assume values between 1 and \( N \) with \( N \) as the number of data points.

In case of baseline calculation before initiating the fit procedure, the background is set to the averaged experimental function \( M(E) \) in a sector around the chosen start and end channels. With \( i_1 \) as left channel (\( E_{1_1} \): low energy side) and \( i_2 \) as right channel (\( E_{1_2} \): high energy side) the simulation of the baseline is obtained as
\[ U(E_1) = M(E_1) \]

and

\[ U(E_2) = M(E_2) \]

If ZAP is the number of points used for averaging (can be set in the preferences), the intensity of the averaged measuring function at the low energy side is calculated by

\[ M(i_1) = \frac{\sum_{i=0}^{ZAP-1} M(i_1 + i)}{ZAP} \]

and at the high energy side by

\[ M(i_2) = \frac{\sum_{i=0}^{ZAP-1} M(i_2 + i)}{ZAP} \]

In many cases the Shirley model turned out to be a successful approximation for the inelastic background of core level peaks of buried species, which suffered significantly from inelastic losses of the emitted photoelectrons. The calculation of the baseline is an iterative procedure. The number of iteration cycles should be chosen high enough so that the shape of the obtained background function does not change anymore. The analytical expression for the Shirley background is

\[ U(E) = \int_{E}^{\infty} F(E')dE' + c \]

The algorithm of Proctor and Sherwood ([1] A. Proctor, P.M.A. Sherwood, Anal. Chem. 54 (1982) 13) is based on the assumption that for every point of the spectrum the background intensity generated by a photoelectron line is proportional to the number of all photoelectrons with higher kinetic energy. The intensity of the background \( U(i) \) in channel \( i \) is given by

\[ U(i) = \frac{(a - b)Q(i)}{P(i) + Q(i)} + b \]

where \( a \) and \( b \) are the measured intensities in channel \( i_1 \) and \( i_2 \), respectively, and \( P(i) \) and \( Q(i) \) represent the effective peak areas to lower and higher kinetic energies relative to the channel under consideration. An iterative procedure is necessary because \( P, Q, \) and \( U(i) \) are unknown. In first approximation \( U(i) = b \) is used.

The function baseline.shirley implements the shirley baseline. It is an iterative algorithm. The iteration stops when the deviation between two consequent iteration is lower than \( err \) or when the max number of iterations \( maxit \) is reached.

**Value**

The baseline function return an object of class baseline.

```r
data("O1s")
Data <- O1s

## The same example with C1s data
# data("C1s")
# Data <- C1s

Y <- Data[2,, drop = FALSE]
X <- Data[1,]

corrected <- baseline(Y, method = "shirley", t = X)
plot(corrected, rev.x = TRUE, labels = X)

## Not run:
# Dependent on external software
baselineGUI(Y, labels=X, method="shirley")

## End(Not run)
```

---

baseline.TAP  TAP

Description
An implementation of Roman Svoboda and Jirí Málek’s algorithm for baseline identification in kinetic analysis of derivative kinetic data.

Usage
`baseline.TAP(spectra, t, interval = 15, tol = 0.001)`

Arguments
- `spectra` : Matrix with spectra in rows
- `t` : Optional vector of spectrum abcissa
- `interval` : Distance from spectrum end to starting points for the TAP (default = 15)
- `tol` : Tolerance of difference between iterations (default = 0.001)
Details
(i) A first approximation of the baseline equation is selected as the straight line between start and end of the curve. (ii) Based on the first approximation of the baseline equation, the phase change progress parameter is calculated. (iii) An updated equation of the baseline is calculated and the phase change progress parameter equation from step (ii). (iv) The baseline equation from step (iii) is compared (point by point) with the one from the previous iteration. If the convergence criterion is met (the difference between every baseline value corresponding to two successive iterations was less than 0.1%) the procedure is stopped and the final baseline equation is selected. If the convergence criterion is not fulfilled then a new iteration is carried out from step (ii) until convergence was achieved.

Value
baseline Matrix of baselines corresponding to spectra spectra
corrected Matrix of baseline corrected spectra

myAlpha <- c(myAlpha,
    seq(myAlpha[90]-0.001, 0.01, length.out=40))
myAlpha <- myAlpha - min(myAlpha)
myAlpha <- cumsum(dadt <- myAlpha/sum(myAlpha))

# Discrete derivative
mydAlpha <- c(0,diff(myAlpha)); mydAlpha <- matrix(mydAlpha, ncol=length(mydAlpha))
rm(myAlpha) # Throw away myAlpha

# Compute baseline from T and derivative
B <- baseline(mydAlpha, t=myT, method="TAP")

# Plot
plot(B, xlab = "T", ylab = "da/dT")
```
**Description**

A class that describes a baseline correction algorithm. The idea is that it contains all information needed to use an algorithm with the optimisation framework and the graphical user interface (but see Notes below).

**Objects from the Class**

Objects can be created by calls of the form `new("baselineAlg", ...)`.

**Slots**

- **name**: Short-name of the algorithm. This must match the name of the object in the `baselineAlgorithms` list of algorithms, and is used throughout the code to identify the algorithm. It should thus start with a letter and contain only letters, digits, underscores ("_") or dots (".").
- **description**: Description of the algorithm, typically the full name. This will be used in the code to describe the algorithm, so it should not be too long, and not contain newline characters.
- **funcName**: The name of the function used to estimate the baseline. The function must take an argument `spectra`, and return a list with the estimated baselines (baseline) original spectra (`spectra`) and the corrected spectra (`corrected`). It can also take other arguments (typically parameters) and return additional components in the list.
- **param**: A data frame with information about the parameters of the algorithm. It should contain the following columns: `name` - the name of the parameter; `integer` - TRUE if the parameter only takes integer values, otherwise FALSE; `min` - the lower limit of allowed values; `incl.min` - TRUE if the lower limit is an allowed value, otherwise FALSE; `default` - the default value; `max` - the upper limit of allowed values; `incl.max` - TRUE if the upper limit is an allowed value, otherwise FALSE

**Methods**

- **description** signature(object = "baselineAlg"): Extract the description slot
- **funcName** signature(object = "baselineAlg"): Extract the funcName slot
- **name** signature(object = "baselineAlg"): Extract the name slot
- **param** signature(object = "baselineAlg"): Extract the param slot

**Note**

The goal is that the optimisation framework and the GUI code should get all information about available baseline algorithms through a list of `baselineAlg` objects. This will make it relatively simple to add new baseline algorithms.

Currently, there is information about the algorithms spread around in the code. We plan to move that information into the `baselineAlg` objects, and expand the class accordingly.
Author(s)
Bjørn-Helge Mevik and Kristian Hovde Liland

Examples

showClass("baselineAlg")

---

**baselineAlgorithms**  List of available baseline algorithms

**Description**

A list with descriptions of all baseline algorithms available through the optimisation framework and graphical user interface. The elements of the list are `baselineAlg` objects. The list is used by the code to extract names and information about the baseline algorithms.

**Details**

The list is not meant for usage by end-users, but is extendable and customizable, allowing for extra algorithms or removal of algorithms.

The names of the list must match the name slot of the elements.

**Examples**

```r
## Get a list of all algorithms:
names(baselineAlgorithms)

## Show the descriptions
sapply(baselineAlgorithms, description)

## Add new algorithm
baseline.my.alg <- function(spectra, kappa=1, gamma=1){
  baseline <- spectra-kappa+gamma
  corrected <- spectra-baseline
  list(baseline=baseline,corrected=corrected)
}

baselineAlgorithms$my.alg = new("baselineAlg",
  name = "my.alg",
  description = "A new baseline correction algorithm",
  funcName = "baseline.my.alg",
  param = data.frame(
    name = c("kappa","gamma"), # maxit
    integer = c(FALSE, FALSE),
    min = c(0, 0),
    incl.min = c(TRUE, TRUE),
    default = c(1, 1),
    max = c(Inf, 1),
    incl.max = c(FALSE, TRUE)
  ))
```
baselineAlgorithmsGUI

List of available baseline algorithms for GUI function

Description
A list with data.frames containing parameters, minimum and maximum values for GUIs, step
lengths for sliders, default values and currently selected values, plus a short description of each
parameter. The list is used by the GUIs, and is user customizable.

Details
The list is not meant for usage by end-users, but is extendable and customizable, allowing for extra
algorithms, removal of algorithms or changing of parameter sets.

Examples
```r
## Get a list of all algorithms:
names(baselineAlgorithmsGUI)
## Add new algorithm:
baselineAlgorithmsGUI$my.alg <- as.data.frame(matrix(c(0,20,1,1, 0,20,1,1), 2,4, byrow=TRUE))
dimnames(baselineAlgorithmsGUI$my.alg) <- list(par=c("kappa", "gamma"),
val=c("min","max","step","default"))
baselineAlgorithmsGUI$my.alg$current <- c(1,1)
baselineAlgorithmsGUI$my.alg$name <- c("Subtractive constant", "Additive constant")
```

baselineAlgResult-class

Class "baselineAlgResult"

Description
A class describing the result of a baseline algorithm test

Objects from the Class
Objects are typically created by running runTest on a baselineAlgTest object.

Slots
param: A named list with the parameter values that were tested. This includes both the predictor
parameters and the baseline algorithm parameters. All combinations of values are tested.
qualMeas: A matrix of quality measure values for the different combinations of parameter values.
Each row corresponds to one prediction parameter value, and each column to one combina-
tion of baseline parameters.
qualMeas.ind.min: The index in qualMeas of the minimum quality measure value
baselineAlgTest-class

minQualMeas: The minimum quality measure value
param.ind.min: A vector of indices into the elements of param of the parameter values corresponding to the minimum quality measure value
param.min: A list of the parameter values corresponding to the minimum quality measure value
qualMeasName: The name of the quality measure

Methods

minQualMeas signature(object = "baselineAlgResult"): Extract the minQualMeas slot
param signature(object = "baselineAlgResult"): Extract the param slot
param.ind.min signature(object = "baselineAlgResult"): Extract the param.ind.min slot
param.min signature(object = "baselineAlgResult"): Extract the param.min slot
qualMeas signature(object = "baselineAlgResult"): Extract the qualMeas slot
qualMeas.ind.min signature(object = "baselineAlgResult"): Extract the qualMeas.ind.min slot

qualMeasName signature(object = "baselineAlgResult"): Extract the qualMeasName slot

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Class baselineAlgTest, function runTest.

Examples

showClass("baselineAlgResult")
Methods

**algorithm** signature(object = "baselineAlgTest"): Extract the algorithm slot

**extraArgs** signature(object = "baselineAlgTest"): Extract the extraArgs slot...

**funcName** signature(object = "baselineAlgTest"): Extract the funcName slot...

**param** signature(object = "baselineAlgTest"): Extract the param slot

**runTest** signature(object = "baselineAlgTest"): Run the test.

```

---

**baselineEnv**  
*Baseline environment*

Description

Methods to access the baseline environment.

Usage

```
baselineEnv()  
getBaselineEnv(x, mode="any")  
putBaselineEnv(x, value)
```

Arguments

- **x** Name of object to put/get.
- **mode** Mode of object to get.
- **value** Object to put.

Value

getBaseline retrieves an object.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik
See Also

The functions implementing the baseline algorithms: `baseline.als, baseline.fillPeaks, baseline.irls, baseline.lowpass, baseline.medianWindow, baseline.modpolyfit, baseline.peakDetection, baseline.rfbaseline, baseline.rollingBall`

Examples

```r
putBaselineEnv('fish', '<=x<=')
getBaselineEnv('fish')
```

---

**baselineGUI**

*Interactive plotting tool*

Description

An interactive plotting tool for dynamic visualization of baselines and their effect using the gWidgets2 package with GTK+ or Tcl/Tk.

Usage

```r
baselineGUI(spectra, method='irls', labels, rev.x = FALSE)
```

Arguments

- `spectra`  
  Matrix with spectra in rows
- `method`  
  Baseline correction method (optional)
- `labels`  
  Labels for X-axis (optional)
- `rev.x`  
  Reverse X-axis (optional, default=FALSE)

Details

Creates and updates a list containing current baseline and spectrum (baseline.result). Make sure a gWidget2 implementation is available, e.g gWidgets2RGtk2 or gWidgets2tcltk and a corresponding backend like GTK+ or Tcl/Tk. The GUI was developed using GTK which is an external dependency in Windows and OS X.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

Examples

```r
data(milk)
## Not run:
# Dependent on external software
baselineGUI(milk$spectra)
## End(Not run)
```
Description

This function rescales spectrum abscissa by use of breaks and gaps before baseline correction. The effect is that the chosen baseline correction algorithm and parameters will have varying effects along the spectra, effectively giving local control of the amount of rigidity/flexibility of the estimated baseline.

Usage

custom.baseline(spectra, breaks, gaps, trans.win = NULL, just.plot = FALSE, method, ...)

Arguments

spectra Matrix with spectra in rows.
breaks Vector of locations of break points between sections of varying baseline flexibility (given as abscissa numbers).
gaps Vector giving the abscissa spacing between each instance of breaks (and endpoints if not specified in breaks).
trans.win Optional width of transition window around break points used for smoothing rough breaks by LOWESS (default = NULL).
just.plot Plot the rescaled spectra instead of applying the customized baseline correction if just.plot=TRUE (default = FALSE).
method Baseline correction method to use (class character).
... Additional named arguments to be passed to the baseline correction method.

Details

This is an implementation of the customized baseline correction suggested by Liland et al. 2011 for local changes in baseline flexibility.

Value

baseline Estimated custom baselines.
corrected Spectra corrected by custom baselines.
spectra.scaled Re-scaled spectra.
baseline.scaled Estimated baselines of re-scaled spectra.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik
doOptim

Optimise several baseline algorithms on a data set

Description

Tests several baseline algorithms with one predictor for a given data set. The baseline algorithms are represented as a list of baselineAlgTest objects, and the predictor as a predictionTest object.

Usage

doOptim(baselineTests, X, y, predictionTest, postproc = NULL, tmpfile = "tmp.baseline", verbose = FALSE, cleanTmp = FALSE)

Arguments

baselineTests a list of baselineAlgTest objects. The baseline algorithms and parameter values to test
X A matrix. The spectra to use in the test
y A vector or matrix. The response(s) to use in the test
predictionTest A predictionTest object. The predictor and parameter values to use in the test
postproc A function, used to postprocess the baseline corrected spectra prior to prediction testing. The function should take a matrix of spectra as its only argument, and return a matrix of postprocessed spectra
tmpfile The basename of the files used to store intermediate calculations for checkpointing. Defaults to "tmp.baseline"
verbose Logical, specifying whether the test should print out progress information. Default is FALSE
cleanTmp Logical, specifying whether the intermediate files should be deleted when the optimisation has finished. Default is FALSE

References

Kristian Hovde Liland et al.: Customized baseline correction

Examples

data(milk)
spectrum1 <- milk$spectra[1,1:10000,drop=FALSE]
ordinary <- baseline(spectrum1, method="als", lambda=6, p=0.01)
customized <- custom.baseline(spectrum1, 2900, c(1,20), trans.win=100, just.plot=FALSE, method="als", lambda=6, p=0.01)
## Not run:
plot(1:10000, spectrum1, type='l')
lines(1:10000, getBaseline(ordinary), lty=2, col=2, lwd=2)
lines(1:10000, customized$baseline, lty=3, col=3, lwd=2)
## End(Not run)
Details

The function loops through the baseline algorithm tests in `baselineTests`, testing each of them with the given data and prediction test, and collects the results. The results of each baseline algorithm test is saved in a temporary file so that if the optimisation is interrupted, it can be re-run and will use the pre-calculated results. If `cleanTmp` is TRUE, the temporary files are deleted when the whole optimisation has finished.

Value

A list with components

- `baselineTests` The `baselineTests` argument
- `results` A list with the `baselineAlgResult` objects for each baseline test
- `minQualMeas` The minimum quality measure value
- `baselineAlg.min` The name of the baseline algorithm giving the minimum quality measure value
- `param.min` A list with the parameter values corresponding to the minimum quality measure value

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

- `baselineAlgTest`, `predictionTest`

Description

Extract the "funcName" slot.

Usage

`funcName(object)`

Arguments

- `object` An object of class `baselineAlg` or `baselineAlgTest`

Value

The `funcName` slot of the object.
getBaseline

Functions to extract the components of a "baseline" object

Description
The functions extract the baseline, spectra, corrected or call slot of a baseline object; usually the result of a call to baseline.

Usage
getBaseline(object)
g getSpectra(object)
g getCorrected(object)
g getCall(object)

Arguments
object A baseline object

Value
g getCall returns the baseline call used to create the object. The other functions return a matrix with the original spectra, estimated baselines or corrected spectra.

Warning
In a future version, one of the slots might be removed from the class definition and calculated on the fly instead, in order to save space. Therefore, do use the extractor functions (getSpectra, getBaseline and getCorrected) instead of accessing the slots directly.

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also
The function baseline, the class baseline
Examples

```r
data(milk)
bl <- baseline(milk$spectra[1:2,])
baseline <- getBaseline(bl)
spectra <- getSpectra(bl)
corrected <- getCorrected(bl)
call    <- getCall(bl)
```

### Description

Extract information from objects of class `predictionResult`.

### Usage

```r
ind.min(object)
paramName(object)
```

### Arguments

- `object` Object of class `predictionResult`

### Value

The corresponding slot of the object.

### See Also

- `predictionResult`
milk  

MALDI-TOF mass spectra

Description
Matrix of 45 spectra of 21451 m/z values from MALDI-TOF on mixed milk samples.

Usage
data(milk)

Format
A data frame with 45 observations on the following 2 variables.

  cow  a numeric vector
  spectra  a matrix with 21451 columns

Details
cow is the concentration of cow milk in mixed samples of cow, goat, and ewe milk.

References

and Tomas Isaksson (2009) Quantitative whole spectrum analysis with MALDI-TOF MS, Part I:

Examples
data(milk)
## Not run:
plot(milk$spectra[1,], type = "l")
## End(Not run)

name  

Extraction methods for "baselineAlg" objects

Description
Extraction methods specifically for objects of class baselineAlg

Usage
name(object)
description(object)
**optimWizard**

**Arguments**

- **object** Object of class `baselineAlg`

**Value**

The methods return the corresponding slot of the object.

**Author(s)**

Bjørn-Helge Mevik and Kristian Hovde Liland

**See Also**

`baselineAlg`, `funcName`.

---

**optimWizard**

*Visual tool for setting up optimization*

**Description**

Set up optimization through a graphical user interface. Optionally collecting values directly from 'baselineGUI'. Retrieve optimisation parameters and results with `getOptim` and `getOptimRes`, respectively.

**Usage**

```r
optimWizard(X, y, postproc, predictionTest, cvsegments)
getOptim()
getOptimRes()
```

**Arguments**

- **X** Matrix with spectra in rows
- **y** Response vector or matrix in analysis
- **postproc** Custom function for post processing of spectra (optional)
- **predictionTest** Custom prediction object (optional)
- **cvsegments** Cross-validation segments (optional)

**Author(s)**

Kristian Hovde Liland and Bjørn-Helge Mevik
Examples

```r
## Not run:
# Computationally intensive
data(milk)
X <- milk$spectra[, -1]
y <- milk$spectra[, 1]
optimWizard(X, y)

# Retrieve optimisation
myResults <- getOptimRes()

# After optimisation is complete
plotOptim(myResults)

## End(Not run)
```

---

**overall.min**  
*Extract the minimum from a baseline optimisation*

**Description**

Takes the result of an optimisation (a call to `doOptim`) and extracts the minimum quality measure value along with the parameters giving rise to the value.

**Usage**

```r
overall.min(results)
```

**Arguments**

- `results`  
  Result of call to `doOptim`

**Value**

A list with components

- `qualMeas`  
  The minimum quality measure value
- `algorithm`  
  The name of the baseline algorithm corresponding to the minimum
- `param`  
  A list with the parameter values corresponding to the minimum quality measure value

**Author(s)**

Bjørn-Helge Mevik and Kristian Hovde Liland

**See Also**

- `doOptim`
**Description**
Extracts the param slot of the object.

**Usage**

\[
\text{param}(\text{object})
\]

**Arguments**

- **object**: An object of class `baselineAlg`, `baselineAlgTest`, `baselineAlgResult` or `predictionResult`.

**Value**

The param slot of the object. Usually a data frame, list or numeric.

**Author(s)**

Bjørn-Helge Mevik and Kristian Hovde Liland

**See Also**

Classes `baselineAlg`, `baselineAlgTest`, `baselineAlgResult`, `predictionResult`

---

**Description**

Extraction methods that are specific for objects of class `baselineAlgResult`.

**Usage**

\[
\text{param.ind.min}(\text{object}) \\
\text{QualMeas.ind.min}(\text{object})
\]

**Arguments**

- **object**: Object of class `baselineAlgResult`.

**Value**

The corresponding slot.
plotBaseline

Plot method for "baseline" objects

Description
Plot the original spectrum, the estimated baseline, and the corrected spectrum. Optionally zoom and pan plot, either with arguments or interactively.

Usage
## S4 method for signature 'baseline'
plot(x, y, specNo = 1, grid = FALSE, labels = 1:n, rev.x = FALSE, zoom = NULL, ...)
plotBaseline(x, y, specNo = 1, grid = FALSE, labels = 1:n, rev.x = FALSE, zoom = list(xz = 1, yz = 1, xc = 0, yc = 0), ...)

Arguments
- **x**: The baseline object to be plotted
- **y**: Unused. Ignored with a warning
- **specNo**: The row number of the spectrum and baseline to plot. Defaults to 1
- **grid**: Logical. Whether to show a grid or not. Defaults to FALSE
- **labels**: Vector. Labels for the x tick marks. Defaults to 1:n
- **rev.x**: Logical. Whether the spectrum should be reversed. Defaults to FALSE
- **zoom**: Either TRUE (only for the plot method), which turns on the interactive zoom controls, or a list with components xz, xc, yz and yc, which specifies the desired zoom and pan. Defaults to no zoom or pan
- **...**: Other arguments. Currently ignored

Details
The normal way to plot baseline objects is to use the plot method. The plotBaseline function is the underlying work-horse function, and is not meant for interactive use.

Note
Because the argument list of any plot method must start with x, y, and the plot method for the baseline class does not use the y argument, all arguments except x must be named explicitly. Positional matching will not work.
plotOptim

Author(s)
Kristian Hovde Liland and Bjørn-Helge Mevik

See Also
baseline, baseline, baselineGUI

Examples

data(milk)
bl <- baseline(milk$spectra[1,, drop=FALSE])
## Not run:
   # Computationally intensive
plot(bl)
plot(bl, zoom = TRUE)
## End(Not run)

plotOptim

Plotting tool for result objects from optimization

Description
A graphical user interface for plotting optimisation results, either one algorithm at the time or comparing algorithms.

Usage
plotOptim(results)

Arguments
results Result list from optimization

Details
plotOptim creates a user interface based on the supplied results. Curve and level plots from single algorithms or comparison of algorithms is available.

For single algorithms subsets, levels corresponding to local or global minima, and averages can be extracted for plotting. For comparison of algorithms levels corresponding to local or global minima can be used, or levels corresponding to the minimum when averaging over selected values of the regression parameter, e.g. selected components in PLSR.

Author(s)
Kristian Hovde Liland and Bjørn-Helge Mevik
Description

A class describing a PLSR prediction test. To run the test, the "pls" package must be installed.

Objects from the Class

Objects can be created by calls of the form new("PLSRTest", ...).

Slots

ncomp: Integer vector. The number of PLSR components to test
cvsegments: A list of the segments to use in the cross-validation

Extends

Class predictionTest, directly.

Methods

runTest signature(object = "PLSRTest"): Run the test

Author(s)

Bjørn-Helge Mevik and Krisitan Hovde Liland

See Also

The base class predictionTest. The runTest function. The plsr function from the "pls" package.

Examples

showClass("PLSRTest")
**predictionResult-class**

*Class "predictionResult"*

---

**Description**

A class containing the result of running a `predictionTest`.

**Objects from the Class**

The normal way to create objects is by calling the method `runTest` for any object of subclass of `predictionTest`.

**Slots**

- `param`: Numeric vector. The regression parameter values tested.
- `qualMeas`: Numeric vector. The quality measure values for each of the values of the `param` slot.
- `ind.min`: The index (into `qualMeas`) of the minimum quality measure value.
- `minQualMeas`: The minimum quality measure value.
- `param.min`: The value of the parameter value corresponding to the minimum quality measure value.
- `qualMeasName`: The name of the quality measure.
- `paramName`: The name of the regression parameter.

**Methods**

- `ind.min` signature(object = "predictionResult"): Extract the `ind.min` slot.
- `minQualMeas` signature(object = "predictionResult"): Extract the `minQualMeas` slot.
- `param` signature(object = "predictionResult"): Extract the `param` slot.
- `param.min` signature(object = "predictionResult"): Extract the `param.min` slot.
- `paramName` signature(object = "predictionResult"): Extract the `paramName` slot.
- `qualMeas` signature(object = "predictionResult"): Extract the `qualMeas` slot.
- `qualMeasName` signature(object = "predictionResult"): Extract the `qualMeasName` slot.

**Author(s)**

Bjørn-Helge Mevik and Kristian Hovde Liland

**See Also**

Function `runTest`, class `predictionTest`, subclasses `PLSRTest` and `ridgeRegressionTest`.

**Examples**

`showClass("predictionResult")`
predictionTest-class  

Class "predictionTest"

Description

A virtual class for all predictor test subclasses. Currently subclasses PLSRTest and ridgeRegressionTest are defined.

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

No methods defined with class "predictionTest" in the signature.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Subclasses PLSRTest and ridgeRegressionTest.

qualMeas  

Extraction functions for "predictionResult" or "baselineAlgResult" objects

Description

Extract slots from objects of class predictionResult or baselineAlgResult.

Usage

qualMeas(object, ...)
## S4 method for signature 'predictionResult'
qualMeas(object, ...)
## S4 method for signature 'baselineAlgResult'
qualMeas(object, ..., MIN, AVG,
    DEFAULT = c("all", "cond.min", "overall.min", "avg"))
minQualMeas(object)
param.min(object)
qualMeasName(object)
Arguments

- **object**: An object of class `predictionResult` or `baselineAlgResult`
- **MIN**: List or vector of parameter names to take the minimum over. Not used if `DEFAULT` is "cond.min". See Details
- **AVG**: List or vector of parameter names to take the average over. Not used if `DEFAULT` is "avg". See Details
- **DEFAULT**: Character string. The default way to calculate the minimum (or average) for all parameters. See Details
- **...**: Other arguments. Selection of subsets of parameter levels. See Details

Details

The arguments to the `baselineAlgResult` method are interpreted in the following way:

Subsets of parameters levels can be selected by supplying their names and specifying the level indices as vectors. Substituting a vector with "all" will return all levels of the corresponding parameter, and substituting it with "overall" will return the level corresponding to the overall minimum. Minimum and average values for selected parameters can be chosen using MIN and AVG, respectively, together with a vector of parameter names.

`DEFAULT` specifies the action for each remaining parameters: If "all" (default): returns all levels. If "cond.min": take minimum for each remaining parameter (MIN is not used). If "overall.min": set any remaining parameters to their value corresponding to the overall min. If "avg": take average for each remaining parameter (AVG is not used).

Value

The `qualMeas` method for `baselineAlgResult` objects returns the subsets or minimum values of the `qualMeas` slot of the object as specified above. All other methods simply return the corresponding slot.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Function `runTest`, classes `baselineAlgResult` and `predictionResult`
Objects from the Class

Objects can be created by calls of the form `new("ridgeRegressionTest", ...).

Slots

lambdas: Numeric vector. The smoothing parameter values to test

Extends

Class `predictionTest`, directly.

Methods

`runTest` signature(object = "ridgeRegressionTest"): Run the test

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

The base class `predictionTest`. The `runTest` function.

Examples

```
showClass("ridgeRegressionTest")
```

---

**runTest**

Run a `predictionTest` or `baselineAlgTest`

**Description**

Runs the test defined in a `predictionTest` or `baselineAlgTest` object

**Usage**

```
runTest(object, X, y, ...)
## S4 method for signature 'PLSRTest'
runTest(object, X, y)
## S4 method for signature 'ridgeRegressionTest'
runTest(object, X, y)
## S4 method for signature 'baselineAlgTest'
runTest(object, X, y, predictionTest, postproc, verbose = FALSE)
```
Arguments

- **object**: An object of class `baselineAlgTest` or subclass of `predictionTest` (currently `PLSRTest` or `ridgeRegressionTest`). The object specify the test to be run.
- **X**: A matrix. The spectra to use in the test.
- **y**: A vector or matrix. The response(s) to use in the test.
- **predictionTest**: A `predictionTest` object, describing the prediction test to use for this baseline algorithm test.
- **postproc**: A function, used to postprocess the baseline corrected spectra prior to prediction testing. The function should take a matrix of spectra as its only argument, and return a matrix of postprocessed spectra.
- **verbose**: Logical, specifying whether the test should print out progress information. Default is `FALSE`.
- **...**: Other arguments. Currently only used by the `baselineAlgTest` method.

Value

`runTest` returns an object of class `predictionResult` or `baselineAlgResult`.

Methods

- `signature(object = "baselineAlgTest")`: Baseline corrects the spectra, optionally postprocesses them, and runs a prediction test on the corrected spectra.
- `signature(object = "PLSRTest")`: Runs PLSR on the data and calculates the cross-validated RMSEP.
- `signature(object = "ridgeRegressionTest")`: Runs ridge regression on the data and calculates the GCV.
