Package ‘twang’

October 14, 2022

Version 2.5
Date 2021-10-20
Title Toolkit for Weighting and Analysis of Nonequivalent Groups
Author Matthew Cefalu <Matthew_Cefalu@rand.org>, Greg Ridgeway, Dan McCaffrey, Andrew Morral, Beth Ann Griffin, and Lane Burgette
Maintainer Matthew Cefalu <Matthew_Cefalu@rand.org>
Depends R (>= 2.10)
Imports gbm (>= 1.5-3), survey, xtable, lattice, latticeExtra, MatrixModels, data.table, ggplot2, xgboost
Suggests knitr
Description Provides functions for propensity score estimating and weighting, nonresponse weighting, and diagnosis of the weights.
License GPL-3 | file LICENSE
Encoding UTF-8

twang: Toolkit for Weighting and Analysis of Nonequivalent Groups

Description

Provides functions for propensity score estimating and weighting, nonresponse weighting, and diagnosis of the weights.

AOD

Subset of Alcohol and Other Drug treatment data

Description

A small subset of the data from McCaffrey et al. (2013).

Usage

data(AOD)

Format

A data frame with 600 observations on the following 10 variables.

treat  Treatment that each study subject received. Either community, metcbt5, or scy.
suf12  outcome variable, substance use frequency at 12 month follow-up
illact  covariate, illicit activities scale
crimjust  covariate, criminal justice involvement
subprob  covariate, substance use problem scale
subdep  covariate, substance use dependence scale
white  1 if non-Hispanic white, 0 otherwise

References

bal.stat

Calculate weighted balance statistics

Description

‘bal.stat’ compares the treatment and control subjects by means, standard deviations, effect size, and KS statistics
Usage

bal.stat(
  data,
  vars = NULL,
  treat.var,
  w.all,
  sampw,
  get.means = TRUE,
  get.ks = TRUE,
  na.action = "level",
  estimand,
  multinom,
  fillNAs = FALSE
)

Arguments

data A data frame containing the data
vars A vector of character strings with the names of the variables on which the function will assess the balance
treat.var The name of the treatment variable
w.all Observation weights (e.g. propensity score weights, sampling weights, or both)
sampw Sampling weights. These are passed in addition to ‘w.all’ because the "unweighted" results should be adjusted for sample weights (though not propensity score weights).
get.means logical. If ‘TRUE’ then ‘bal.stat’ will compute means and variances
get.ks logical. If ‘TRUE’ then ‘bal.stat’ will compute KS statistics
na.action A character string indicating how ‘bal.stat’ should handle missing values. Current options are "level", "exclude", or "lowest"
estimand Either "ATT" or "ATE"
multinom logical. 'TRUE' if used for multinomial propensity scores.
fillNAs logical. If ‘TRUE’, fills in zeros for missing values.

Details
‘bal.stat’ calls auxiliary functions for each variable and assembles the results in a table.

Value
‘get.means’ and ‘get.ks’ manipulate the inclusion of certain columns in the returned result.

References
**bal.table**

Compute the balance table.

**Description**

Extract the balance table from ps, dx.wts, and mnps objects

**Usage**

```r
bal.table(
  x, digits = 3, collapse.to = c("pair", "covariate", "stop.method")[[1]],
  subset.var = NULL, subset.treat = NULL, subset.stop.method = NULL,
  es.cutoff = 0, ks.cutoff = 0, p.cutoff = 1, ks.p.cutoff = 1,
  timePeriods = NULL,
  ...
)
```

**Arguments**

- `x` A ps or dx.wts object.
- `digits` The number of digits that the numerical entries should be rounded to. Default: 3.
- `collapse.to` For mnps ATE objects, the comparisons can be given for all pairs (default), summarized by pre-treatment covariate and stop.method, or as a single summary for each stop.method.
- `subset.var` Eliminate all but a specified subset of covariates.
- `subset.treat` Subset to either all pairs that include a specified treatment or a single pair of treatments.
- `subset.stop.method` Subset to either all pairs that include a specified treatment or a single pair of treatments.
- `es.cutoff` Subsets to comparisons with absolute ES values bigger than es.cutoff. Default: 0.
- `ks.cutoff` Subsets to comparisons with KS values bigger than ks.cutoff. Default: 0.

**See Also**

The example for [ps] contains an example of the use of [bal.table]
p.cutoff  Subsets to comparisons with t- or chi-squared p-values no bigger than p.cutoff. Default: 1.

ks.p.cutoff  Subsets to comparisons with t- or chi-squared p-values no bigger than p.cutoff. Default: 1.

timePeriods  Used to subset times for iptw fits.

...  Additional arguments.

Details

bal.table is a generic function for extracting balance tables from ps and dx.wts objects. These objects usually have several sets of candidate weights, one for an unweighted analysis and perhaps several stop.methods. bal.table will return a table for each set of weights combined into a list. Each list component will be named as given in the x, usually the name of the stop.method. The balance table labeled “unw” indicates the unweighted analysis.

Value

Returns a data frame containing the balance information.

- tx.mn The mean of the treatment group.
- tx.sd The standard deviation of the treatment group.
- ct.mn The mean of the control group.
- ct.sd The standard deviation of the control group.
- std.eff.sz The standardized effect size, (tx.mn-ct.mn)/tx.sd. If tx.sd is small or 0, the standardized effect size can be large or INF. Therefore, standardized effect sizes greater than 500 are set to NA.
- stat The t-statistic for numeric variables and the chi-square statistic for continuous variables.
- p The p-value for the test associated with stat ks The KS statistic.
- ks.pval The KS p-value computed using the analytic approximation, which does not necessarily work well with a lot of ties.

boxplot.mnps  Boxplot for 'mnps' objects

Description

This function produces a collection of diagnostic plots for mnps objects.
Usage

```r
## S3 method for class 'mnps'
boxplot(
  x,
  stop.method = NULL,
  color = TRUE,
  figureRows = NULL,
  singlePlot = NULL,
  multiPage = FALSE,
  time = NULL,
  print = TRUE,
  ...
)
```

Arguments

- `x`: A ‘ps’ object
- `stop.method`: Only 1 ‘stop.method’ can be presented at a time for ‘mnps’ objects. Use a numeric indicator of which ‘stop.method’ (among those specified when fitting the ‘mnps’ object) should be used.
- `color`: If ‘FALSE’, a grayscale figure will be returned.
- `figureRows`: The number of rows in the figure. Defaults to the number of panels.
- `singlePlot`: If multiple sets of boxplots are produced, ‘singlePlot’ can be used to select only one. For example, ‘singlePlot = 2’ would return only the second set of boxplots.
- `multiPage`: When multiple frames of a figure are produced, ‘multiPage = TRUE’ will print each frame on a different page. This is intended for situations where the graphical output is being saved to a file.
- `time`: For use with iptw fits.
- `print`: If ‘FALSE’, the figure is returned but not printed.
- `...`: Additional arguments that are passed to boxplot function, which may be passed to the underlying ‘lattice’ package plotting functions.

Details

This function produces lattice-style graphics of diagnostic plots.

[mnps]
boxplot.ps

Boxplot for 'ps' objects

Description

This function produces a collection of diagnostic plots for ps objects.

Usage

## S3 method for class 'ps'
boxplot(x, subset = NULL, color = TRUE, time = NULL, ...)

Arguments

x
A 'ps' object

subset
If multiple 'stop.method' rules were used in the 'ps()' call, 'subset' restricts the plots of a subset of the stopping rules that were employed. This argument expects a subset of the integers from 1 to k, if k 'stop.method's were used.

color
If 'FALSE', a grayscale figure will be returned.

time
For use with iptw fits.

...
Additional arguments that are passed to boxplot function, which may be passed to the underlying 'lattice' package plotting functions.

Details

This function produces lattice-style graphics of diagnostic plots.

[ps]
Description

desc.wts assesses the quality of a set of weights on balancing a treatment and control group.

Usage

desc.wts(data, 
  w, 
  sampw = sampw, 
  vars = NULL, 
  treat.var, 
  tp, 
  na.action = "level", 
  perm.test.iters=0, 
  verbose=TRUE, 
  alerts.stack, 
  estimand, multinom = FALSE, fillNAs = FALSE)

Arguments

data a data frame containing the dataset
w a vector of weights equal to nrow(data)
sampw sampling weights, if provided
vars a vector of variable names corresponding to data
treat.var the name of the treatment variable
tp a title for the method “type” used to create the weights, used to label the results
na.action a string indicating the method for handling missing data
perm.test.iters an non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. This argument is ignored is x is a ps object. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%
verbose if TRUE, lots of information will be printed to monitor the the progress of the fitting
alerts.stack an object for collecting warnings issued during the analyses
estimand the estimand of interest: either "ATT" or "ATE"
multinom Indicator that weights are from a propensity score analysis with 3 or more treatment groups.
fillNAs If TRUE fills NAs with zeros.
Details

desc.wts calls bal.stat to assess covariate balance. If perm.test.iters>0 it will call bal.stat multiple times to compute Monte Carlo p-values for the KS statistics and the maximum KS statistic. It assembles the results into a list object, which usually becomes the desc component of ps objects that ps returns.

Value

See the description of the desc component of the ps object that ps returns

See Also

ps

displayPlots  Display plots

Description

Display plots

Usage

displayPlots(ptList, figureRows, singlePlot, multiPage, bxpt = FALSE)

Arguments

ptList A list of plots to display.
figureRows The number of rows in the figure.
singlePlot An integer indicating the index of the plot to display.
multiPage Whether to display plots on multiple pages.
bxpt Whether to display boxplots. Default: ‘FALSE’.
dx.wts  Compute diagnostics assessing covariates balance.

Description

dx.wts takes a ps object or a set of propensity scores and computes diagnostics assessing covariates balance.

Usage

dx.wts(
  x,
  data,
  estimand,
  vars = NULL,
  treat.var,
  x.as.weights = TRUE,
  sampw = NULL,
  perm.test.iters = 0
)

Arguments

x A data frame, matrix, or vector of propensity score weights or a ps object. x can also be a data frame, matrix, or vector of propensity scores if x.as.weights=FALSE.
data A data frame.
estimand The estimand of interest: either "ATT" or "ATE".
vars A vector of character strings naming variables in data on which to assess balance.
treat.var A character string indicating which variable in data contains the 0/1 treatment group indicator.
x.as.weights TRUE or FALSE indicating whether x specifies propensity score weights or propensity scores. Ignored if x is a ps object. Default: TRUE.
sampw Optional sampling weights. If x is a ps object, then the sampling weights should have been passed to ps and not specified here. dx.wts will issue a warning if x is a ps object and sampw is also specified.
perm.test.iters A non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0, then the function returns an analytic approximation to the p-value. This argument is ignored if x is a ps object. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%.
Details

Creates a balance table that compares unweighted and weighted means and standard deviations, computes effect sizes, and KS statistics to assess the ability of the propensity scores to balance the treatment and control groups.

Value

Returns a list containing

- `treat` The vector of 0/1 treatment assignment indicators.

See Also

`ps`

---

**egsingle**

*US Sustaining Effects study*

Description

A subset of the mathematics scores from the U.S. Sustaining Effects Study. The subset consists of information on 1721 students from 60 schools. This dataset is available in the `mlmRev` package.

Usage

`data(egsingle)`

Format

A data frame with 7230 observations on the following 12 variables.

- `schoolid` a factor of school identifiers
- `childid` a factor of student identifiers
- `year` a numeric vector indicating the year of the test
- `grade` a numeric vector indicating the student’s grade
- `math` a numeric vector of test scores on the IRT scale score metric
- `retained` a factor with levels 0 1 indicating if the student has been retained in a grade.
- `female` a factor with levels Female Male
- `black` a factor with levels 0 1 indicating if the student is Black
- `hispanic` a factor with levels 0 1 indicating if the student is Hispanic
- `size` a numeric vector indicating the number of students enrolled in the school
- `lowinc` a numeric vector giving the percentage of low-income students in the school
- `mobility` a numeric vector
get.weights

Source
Reproduced from the mlmRev package for use in the section on nonresponse weighting in the twang package vignette. These data are distributed with the HLM software package (Bryk, Raudenbush, and Congdon, 1996). Conversion to the R format is described in Doran and Lockwood (2006).

---

get.weights

*Extract propensity score weights.*

Description
Extracts propensity score weights from a ps or mnps object.

Usage

```
get.weights(ps1, stop.method = NULL, estimand = NULL, withSampW = TRUE)
```

Arguments

- **ps1** A ps or mnps object.
- **stop.method** Indicates which set of weights to retrieve from the ps object.
- **estimand** Indicates whether the weights are for the average treatment effect on the treated (ATT) or the average treatment effect on the population (ATE). By default, get.weights will use the estimand used to fit the ps object.
- **withSampW** Whether to return weights with sample weights multiplied in, if they were provided in the original ps or mnps call. Default: TRUE.

Details
Weights for ATT are 1 for the treatment cases and p/(1-p) for the control cases. Weights for ATE are 1/p for the treatment cases and 1/(1-p) for the control cases.

Value
Returns a vector of weights.

See Also
- *ps*, *mnps*
get.weights.num  

Get numerators to stabilize propensity score weights for ‘iptw‘ fits.

Description

Forms numerators to stabilize weights for an iptw object.

Usage

get.weights.num(iptw, fitList)

Arguments

iptw  
An ‘iptw‘ object.

fitList  
A list containing objects with an associated "fitted" function.

Value

Returns numerator of stabilized weights to be used in conjunction with ‘get.weights.unstab‘

See Also

[iptw]

get.weights.unstab  
Extract unstabilized propensity score weights for ‘iptw‘ fits

Description

Extracts propensity score weights from an ‘iptw‘ or ‘mniptw‘ object.

Usage

get.weights.unstab(x, stop.method = NULL, withSampW = TRUE)

Arguments

x  
An ‘iptw‘ or ‘mniptw‘ object.

stop.method  
The twop method used for the fit of interest.

withSampW  
Returns weights with sample weights multiplied in, if they were provided in the original ‘iptw‘ call. Default: ‘TRUE‘.

Details

Weights are the reciprocal of the product of the probability of receiving the treatment received.
Value

Returns a data.frame of weights.

See Also

[iptw]

iptw

Inverse probability of treatment weighting for marginal structural models.

Description

iptw calculates propensity scores for sequential treatments using gradient boosted logistic regression and diagnoses the resulting propensity scores using a variety of methods.

Usage

iptw(
  formula,
  data,
  timeInvariant = NULL,
  cumulative = TRUE,
  timeIndicators = NULL,
  ID = NULL,
  priorTreatment = TRUE,
  n.trees = 10000,
  interaction.depth = 3,
  shrinkage = 0.01,
  bag.fraction = 1,
  n.minobsinnode = 10,
  perm.test.iters = 0,
  print.level = 2,
  verbose = TRUE,
  stop.method = c("es.max"),
  sampw = NULL,
  version = "gbm",
  ks.exact = NULL,
  n.keep = 1,
  n.grid = 25,
  ...
)
Arguments

**formula**
Either a single formula (long format) or a list with formulas.

**data**
The dataset, includes treatment assignment as well as covariates.

**timeInvariant**
An optional formula (with no left-hand variable) specifying time-invariant characteristics.

**cumulative**
If TRUE, the time t model includes time-varying characteristics from times 1 through t-1. Default: TRUE.

**timeIndicators**
For long format fits, a vector of times for each observation.

**ID**
For long format fits, a vector of numeric identifiers for unique analytic units.

**priorTreatment**
For long format fits, includes treatment levels from previous times if TRUE. This argument is ignored for wide format fits. Default: TRUE.

**n.trees**
Number of gbm iterations passed on to gbm.

**interaction.depth**
A positive integer denoting the tree depth used in gradient boosting. Default: 3.

**shrinkage**
A numeric value between 0 and 1 denoting the learning rate. See gbm for more details. Default: 0.01.

**bag.fraction**
A numeric value between 0 and 1 denoting the fraction of the observations randomly selected in each iteration of the gradient boosting algorithm to propose the next tree. See gbm for more details. Default: 1.0.

**n.minobsinnode**
An integer specifying the minimum number of observations in the terminal nodes of the trees used in the gradient boosting. See gbm for more details. Default: 10.

**perm.test.iters**
A non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%. Default: 0.

**print.level**
The amount of detail to print to the screen. Default: 2.

**verbose**
If TRUE, lots of information will be printed to monitor the progress of the fitting. Default: TRUE.

**stop.method**
A method or methods of measuring and summarizing balance across pretreatment variables. Current options are ks.mean, ks.max, es.mean, and es.max. ks refers to the Kolmogorov-Smirnov statistic and es refers to standardized effect size. These are summarized across the pretreatment variables by either the maximum (.max) or the mean (.mean). Default: c("es.max").

**sampw**
Optional sampling weights.

**version**
"gbm", "xgboost", or "legacy", indicating which version of the twang package to use.
- "gbm" uses gradient boosting from the gbm package.
- "xgboost" uses gradient boosting from the xgboost package.
- "legacy" uses the prior implementation of the ps function.
iptw

Default: "gbm".

ks.exact

NULL or a logical indicating whether the Kolmogorov-Smirnov p-value should be based on an approximation of exact distribution from an unweighted two-sample Kolmogorov-Smirnov test. If NULL, the approximation based on the exact distribution is computed if the product of the effective sample sizes is less than 10,000. Otherwise, an approximation based on the asymptotic distribution is used. **Warning:** setting ks.exact = TRUE will add substantial computation time for larger sample sizes. Default: NULL.

n.keep

A numeric variable indicating the algorithm should only consider every n.keep-th iteration of the propensity score model and optimize balance over this set instead of all iterations. Default: 1.

n.grid

A numeric variable that sets the grid size for an initial search of the region most likely to minimize the stop.method. A value of n.grid=50 uses a 50 point grid from 1:n.trees. It finds the minimum, say at grid point 35. It then looks for the actual minimum between grid points 34 and 36. If specified with n.keep>1, n.grid corresponds to a grid of points on the kept iterations as defined by 'n.keep. Default: 25.

Additional arguments that are passed to ps function.

Details

For user more comfortable with the options of xgboost, the options for iptw controlling the behavior of the gradient boosting algorithm can be specified using the xgboost naming scheme. This includes nrounds, max_depth, eta, and subsample. In addition, the list of parameters passed to xgboost can be specified with params.

Value

Returns an object of class iptw, a list containing

- psList A list of ps objects with length equal to the number of time periods.
- estimand The specified estimand.
- stop.methods The stopping rules used to optimize iptw balance.
- nFits The number of ps objects (i.e., the number of distinct time points).
- uniqueTimes The unique times in the specified model.

See Also

ps, mnps, gbm, xgboost, plot, bal.table
iptwExLong

Example data for iptw function (long version)

Description

These data are simulated to demonstrate the iptw function in the "long" data format.

Usage

data(lindner)

Format

A list with a covariate matrix and outcomes.
- **covariates** Time-invariant covariates are gender and age. The time-varying covariate is use. The treatment indicator is given by tx. An individual level identifier is given in ID, and the time period is time.
- **outcome** Vector of post-treatment outcomes.

iptwExWide

Example data for iptw function (wide version)

Description

These data are simulated to demonstrate the iptw function in the "wide" data format.

Usage

data(lindner)

Format

A list with a covariate matrix and outcomes.
- **gender** Gender.
- **age** Age.
- **use0** Baseline substance use.
- **use1** Use following first time period treatment.
- **use2** Use following second time period treatment.
- **tx1** Treatment indicator (first time period).
- **tx2** Treatment indicator (second time period).
- **tx3** Treatment indicator (third time period).
- **covariates** Time-invariant covariates are gender and age. The time-varying covariate is use. The treatment indicator is given by tx. An individual level identifier is given in ID, and the time period is time.
- **outcome** Post-treatment outcomes.
**lalonde**

---

**Lalonde’s National Supported Work Demonstration data**

**Description**

One of the datasets used by Dehejia and Wahba in their paper "Causal Effects in Non-Experimental Studies: Reevaluating the Evaluation of Training Programs." Also used as an example dataset in the MatchIt package.

**Usage**

```r
data(lalonde)
```

**Format**

A data frame with 614 observations on the following 10 variables.

- `treat` 1 if treated in the National Supported Work Demonstration, 0 if from the Current Population Survey
- `age` age
- `educ` years of education
- `black` 1 if black, 0 otherwise
- `hispan` 1 if Hispanic, 0 otherwise
- `married` 1 if married, 0 otherwise
- `nodegree` 1 if no degree, 0 otherwise
- `re74` earnings in 1974 (pretreatment)
- `re75` earnings in 1975 (pretreatment)
- `re78` earnings in 1978 (outcome)

lindner  

Lindner Center data on 996 PCI patients analyzed by Kereiakes et al. (2000)

Description

These data are adapted from the lindner dataset in the USPS package. The description comes from that package, except for the variable sixMonthSurvive, which is a recode of lifepres.

Data from an observational study of 996 patients receiving an initial Percutaneous Coronary Intervention (PCI) at Ohio Heart Health, Christ Hospital, Cincinnati in 1997 and followed for at least 6 months by the staff of the Lindner Center. The patients thought to be more severely diseased were assigned to treatment with abciximab (an expensive, high-molecular-weight IIb/IIIa cascade blocker); in fact, only 298 (29.9 percent) of patients received usual-care-alone with their initial PCI.

Usage

data(lindner)

Format

A data frame of 10 variables collected on 996 patients; no NAs.

- lifepres: Mean life years preserved due to survival for at least 6 months following PCI; numeric value of either 11.4 or 0.
- cardbill: Cardiac related costs incurred within 6 months of patient’s initial PCI; numeric value in 1998 dollars; costs were truncated by death for the 26 patients with lifepres == 0.
- abcix: Numeric treatment selection indicator; 0 implies usual PCI care alone; 1 implies usual PCI care deliberately augmented by either planned or rescue treatment with abciximab.
- stent: Coronary stent deployment; numeric, with 1 meaning YES and 0 meaning NO.
- height: Height in centimeters; numeric integer from 108 to 196.
- female: Female gender; numeric, with 1 meaning YES and 0 meaning NO.
- diabetic: Diabetes mellitus diagnosis; numeric, with 1 meaning YES and 0 meaning NO.
- acutemi: Acute myocardial infarction within the previous 7 days; numeric, with 1 meaning YES and 0 meaning NO.
- ejecfrac: Left ejection fraction; numeric value from 0 percent to 90 percent.
- ves1proc: Number of vessels involved in the patient’s initial PCI procedure; numeric integer from 0 to 5.
- sixMonthSurvive: Survival at six months — a recoded version of lifepres.

References

means.table

*Extract table of means from an 'mnps' object*

**Description**

Extracts table of means from an mnps object.

**Usage**

```r
means.table(mnps, stop.method = 1, includeSD = FALSE, digits = NULL)
```

**Arguments**

- `mnps` An ‘mnps‘ object.
- `stop.method` Indicates which set of weights to retrieve from the ‘ps‘ object. Either the name of the stop.method used, or a natural number with 1, for example, . indicating the first stop.method specified.
- `includeSD` Indicates whether standard deviations as well as means are to be displayed. By default, they are not displayed.
- `digits` If not ‘NULL’, results will be rounded to the specified number of digits.

**Details**

Displays a table with weighted and unweighted means and standardized effect sizes, and – if requested – standard deviations.

**Value**

‘A table of means, standardized effect sizes, and perhaps standard deviations, by treatment group.

**See Also**

[mnps]

---

mnIptwExLong

*Example data for iptw function (long version, more than two treatments).*

**Description**

These data are simulated to demonstrate the iptw function in the "long" data format.

**Usage**

```r
data(lindner)
```
**Format**

A list with a covariate matrix and outcomes.

- **covariates** Time-invariant covariates are gender and age. The time-varying covariate is use. The treatment indicator is given by tx. An individual level identifier is given in ID, and the time period is time.
- **outcome** Vector of post-treatment outcomes.

---

**Example data for iptw function (wide version, more than two treatments)**

**Description**

These data are simulated to demonstrate the iptw function in the "wide" data format.

**Usage**

data(lindner)

**Format**

A list with a covariate matrix and outcomes.

- **gender** Gender.
- **age** Age.
- **use0** Baseline substance use.
- **use1** Use following first time period treatment.
- **use2** Use following second time period treatment.
- **tx1** Treatment indicator (first time period).
- **tx2** Treatment indicator (second time period).
- **tx3** Treatment indicator (third time period).
- **covariates** Time-invariant covariates are gender and age. The time-varying covariate is use. The treatment indicator is given by tx. An individual level identifier is given in ID, and the time period is time.
- **outcome** Post-treatment outcomes.
**Description**

`mnps` calculates propensity scores for more than two treatment groups using gradient boosted logistic regression, and diagnoses the resulting propensity scores using a variety of methods.

**Usage**

```r
mnps(
  formula,
  data,
  n.trees = 10000,
  interaction.depth = 3,
  shrinkage = 0.01,
  bag.fraction = 1,
  n.minobsinnode = 10,
  perm.test.iters = 0,
  print.level = 2,
  verbose = TRUE,
  estimand = "ATE",
  stop.method = c("es.max"),
  sampw = NULL,
  version = "gbm",
  ks.exact = NULL,
  n.keep = 1,
  n.grid = 25,
  treatATT = NULL,
  ...
)
```

**Arguments**

- **formula**: A formula for the propensity score model with the treatment indicator on the left side of the formula and the potential confounding variables on the right side.
- **data**: The dataset, includes treatment assignment as well as covariates.
- **n.trees**: Number of gbm iterations passed on to `gbm`. Default: 10000.
- **interaction.depth**: A positive integer denoting the tree depth used in gradient boosting. Default: 3.
- **shrinkage**: A numeric value between 0 and 1 denoting the learning rate. See `gbm` for more details. Default: 0.01.
- **bag.fraction**: A numeric value between 0 and 1 denoting the fraction of the observations randomly selected in each iteration of the gradient boosting algorithm to propose the next tree. See `gbm` for more details. Default: 1.0.
n.minobsinnode  An integer specifying the minimum number of observations in the terminal nodes of the trees used in the gradient boosting. See gbm for more details. Default: 10.

perm.test.iters  A non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%. Default: 0.

print.level  The amount of detail to print to the screen. Default: 2.

verbose  If TRUE, lots of information will be printed to monitor the the progress of the fitting. Default: TRUE.

estimand  "ATE" (average treatment effect) or "ATT" (average treatment effect on the treated) : the causal effect of interest. ATE estimates the change in the outcome if the treatment were applied to the entire population versus if the control were applied to the entire population. ATT estimates the analogous effect, averaging only over the treated population. Default: "ATE".

stop.method  A method or methods of measuring and summarizing balance across pretreatment variables. Current options are ks.mean, ks.max, es.mean, and es.max. ks refers to the Kolmogorov-Smirnov statistic and es refers to standardized effect size. These are summarized across the pretreatment variables by either the maximum (.max) or the mean (.mean). Default: c("es.mean").

sampw  Optional sampling weights.

version  "gbm", "xgboost", or "legacy", indicating which version of the twang package to use.

  • "gbm" uses gradient boosting from the gbm package.
  • "xgboost" uses gradient boosting from the xgboost package.
  • "legacy" uses the prior implementation of the ps function.

Default: "gbm".

ks.exact  NULL or a logical indicating whether the Kolmogorov-Smirnov p-value should be based on an approximation of exact distribution from an unweighted two-sample Kolmogorov-Smirnov test. If NULL, the approximation based on the exact distribution is computed if the product of the effective sample sizes is less than 10,000. Otherwise, an approximation based on the asymptotic distribution is used. **Warning:** setting ks.exact = TRUE will add substantial computation time for larger sample sizes. Default: NULL.

n.keep  A numeric variable indicating the algorithm should only consider every n.keep-th iteration of the propensity score model and optimize balance over this set instead of all iterations. Default: 1.

n.grid  A numeric variable that sets the grid size for an initial search of the region most likely to minimize the stop.method. A value of n.grid=50 uses a 50 point grid from 1:n.trees. It finds the minimum, say at grid point 35. It then looks for the actual minimum between grid points 34 and 36. If specified with n.keep>1, n.grid corresponds to a grid of points on the kept iterations as defined by n.keep. Default: 25.
If the estimand is specified to be ATT, this argument is used to specify which treatment condition is considered 'the treated'. It must be one of the levels of the treatment variable. It is ignored for ATE analyses.

Additional arguments that are passed to `ps` function.

Details

For user more comfortable with the options of `xgboost`, the options for `mnps` controlling the behavior of the gradient boosting algorithm can be specified using the `xgboost` naming scheme. This includes `nrounds`, `max_depth`, `eta`, and `subsample`. In addition, the list of parameters passed to `xgboost` can be specified with `params`.

Note that unlike earlier versions of `twang`, the plotting functions are no longer included in the `mnps` function. See `plot` for details of the plots.

Value

Returns an object of class `mnps`, which consists of the following.

- `psList` A list of `ps` objects with length equal to the number of time periods.
- `nFits` The number of `ps` objects (i.e., the number of distinct time points).
- `estimand` The specified estimand.
- `treatATT` For ATT fits, the treatment category that is considered "the treated".
- `treatLev` The levels of the treatment variable.
- `levExceptTreatAtt` The levels of the treatment variable, excluding the `treatATT` level.
- `data` The data used to fit the model.
- `treatVar` The vector of treatment indicators.
- `stopMethods` The stopping rules specified in the call to `mnps`.
- `sampw` Sampling weights provided to `mnps`, if any.

plot.dxwts  

Description

Plot dxwts

Usage

## S3 method for class 'dxwts'
plot(x, plots = "es", ...)

Arguments

x  
An dxwts object.

plots  
An indicator of which type of plot is desired. The options are

• "optimize" or 1 A plot of the balance criteria as a function of the GBM iteration.
• "boxplot" or 2 Boxplots of the propensity scores for the treatment and control cases
• "es" or 3 Plots of the standardized effect size of the pre-treatment variables before and after reweighing
• "t" or 4 Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting.
• "ks" or 5 Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting.

...  
Additional arguments.

plot.iptw  

Plots for iptw objects

Description

This function produces a collection of diagnostic plots for iptw objects.

Usage

## S3 method for class 'iptw'
plot(
  x,
  plots = "optimize",
  subset = NULL,
  color = TRUE,
)
Arguments

- **x**: An iptw object.
- **plots**: An indicator of which type of plot is desired. The options are
  - "optimize" or 1: A plot of the balance criteria as a function of the GBM iteration.
  - "boxplot" or 2: Boxplots of the propensity scores for the treatment and control cases.
  - "es" or 3: Plots of the standardized effect size of the pre-treatment variables before and after reweighting.
  - "t" or 4: Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting.
  - "ks" or 5: Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting.
- **subset**: Used to restrict which of the stop.methods will be used in the figure. For example, subset = c(1,3) would indicate that the first and third stop.methods (in alphabetical order of those specified in the original call to iptw) should be included in the figure.
- **color**: If color = FALSE, figures will be gray scale. Default: TRUE.
- **timePeriods**: The number of distinct time points. If NULL, this is assumed to be the number of ps objects (i.e., the number of distinct time points).
- **multiPage**: When multiple frames of a figure are produced, multiPage = TRUE will print each frame on a different page. This is intended for situations where the graphical output is being saved to a file. Default: FALSE.
- **figureRows**: The figure rows, passed to displayPlots. Default: NULL.
- **hline**: Arguments passed to panel.abline.
- **...**: Additional arguments.

Details

This function produces lattice-style graphics of diagnostic plots.

iptw

plot.mniptw  Plot mniptw

Description

Plot mniptw

Usage

## S3 method for class 'mniptw'
plot(
  x,
  plots = "optimize",
  pairwiseMax = TRUE,
  figureRows = NULL,
  color = TRUE,
  subset = NULL,
  treatments = NULL,
  singlePlot = NULL,
  multiPage = FALSE,
  timePeriods = NULL,
  hline = c(0.1, 0.5, 0.8),
  ...
)

Arguments

x  An iptw object.
plots  An indicator of which type of plot is desired. The options are
  • "optimize" 1 A plot of the balance criteria as a function of the GBM
    iteration.
  • "boxplot" 2 Boxplots of the propensity scores for the treatment and
    control cases
  • "es" 3 Plots of the standardized effect size of the pre-treatment vari-
    ables before and after reweighing
  • "t" 4 Plots of the p-values from t-statistics comparing means of treated
    and control subjects for pretreatment variables, before and after weighting.
  • "ks" 5 Plots of the p-values from Kolmogorov-Smirnov statistics compar-
    ing distributions of pretreatment variables of treated and control sub-
    jects, before and after weighting.

pairwiseMax  If FALSE, the plots for the underlying ps fits will be returned. Otherwise, pair-
  wise maxima will be returned.
plot.mnps

This function produces a collection of diagnostic plots for \texttt{mnps} objects.

Usage

```r
## S3 method for class 'mnps'
plot(x,
     plots = "optimize",
     pairwiseMax = TRUE,
     figureRows = NULL,
     color = TRUE,
     subset = NULL,
     treatments = NULL,
     singlePlot = NULL,
     multiPage = FALSE,
     time = NULL,
     print = TRUE,
     hline = c(0.1, 0.5, 0.8),
     ...
)
```
**Arguments**

- **x**  
  An `mnps` object.

- **plots**  
  An indicator of which type of plot is desired. The options are:
  - "optimize" or 1 A plot of the balance criteria as a function of the GBM iteration.
  - "boxplot" or 2 Boxplots of the propensity scores for the treatment and control cases.
  - "es" or 3 Plots of the standardized effect size of the pre-treatment variables before and after reweighing.
  - "t" or 4 Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting.
  - "ks" or 5 Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting.

- **pairwiseMax**  
  If FALSE, the plots for the underlying `ps` fits will be returned. Otherwise, pairwise maxima will be returned.

- **figureRows**  
  The number of rows of figures that should be used. If left as NULL, `twang` tries to find a reasonable value.

- **color**  
  If color = FALSE, figures will be gray scale. Default: TRUE.

- **subset**  
  Used to restrict which of the stop.methods will be used in the figure. For example subset = c(1,3) would indicate that the first and third stop.methods (in alphabetical order of those specified in the original call to `mnps`) should be included in the figure.

- **treatments**  
  Only applicable when pairwiseMax is FALSE and plots 3, 4, and 5. If left at NULL, panels for all treatment pairs are created. If one level of the treatment variable is specified, plots comparing that treatment to all others are produced. If two levels are specified, a comparison for that single pair is produced.

- **singlePlot**  
  For Plot calls that produce multiple plots, specifying an integer value of singlePlot will return only the corresponding plot. E.g., specifying singlePlot = 2 will return the second plot.

- **multiPage**  
  When multiple frames of a figure are produced, multiPage = TRUE will print each frame on a different page. This is intended for situations where the graphical output is being saved to a file.

- **time**  
  For use with `iptw`.

- **print**  
  If FALSE, the figure is returned but not printed. Default: TRUE.

- **hline**  
  Arguments passed to `panel.abline`.

- **...**  
  Additional arguments.

**Details**

This function produces lattice-style graphics of diagnostic plots.

mnps

Description

This function produces a collection of diagnostic plots for ps objects.

Usage

```r
## S3 method for class 'ps'
plot(x, plots = "optimize", subset = NULL, color = TRUE, ...)
```

Arguments

- `x` A `ps` object.
- `plots` An indicator of which type of plot is desired. The options are
  - "optimize" or 1 A plot of the balance criteria as a function of the GBM iteration.
  - "boxplot" or 2 Boxplots of the propensity scores for the treatment and control cases
  - "es" or 3 Plots of the standardized effect size of the pre-treatment variables before and after reweighing
  - "t" or 4 Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting.
  - "ks" or 5 Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting.
- `subset` If multiple `stop.method` rules were used in the `ps()` call, `subset` restricts the plots of a subset of the stopping rules that were employed. This argument expects a subset of the integers from 1 to `k`, if `k` `stop.methods` were used.
- `color` If `color = FALSE`, figures will be gray scale. Default: TRUE.
- `...` Additional arguments.

Details

This function produces lattice-style graphics of diagnostic plots.

---

**ps**  * Gradient boosted propensity score estimation*

**Description**

ps calculates propensity scores using gradient boosted logistic regression and diagnoses the resulting propensity scores using a variety of methods

**Usage**

```r
ps()
  formula = formula(data),
  data,
  n.trees = 10000,
  interaction.depth = 3,
  shrinkage = 0.01,
  bag.fraction = 1,
  n.minobsinnode = 10,
  perm.test.iters = 0,
  print.level = 2,
  verbose = TRUE,
  estimand = "ATE",
  stop.method = c("ks.mean", "es.mean"),
  sampw = NULL,
  version = "gbm",
  ks.exact = NULL,
  n.keep = 1,
  n.grid = 25,
```
ps
...)

Arguments

formula
An object of class formula: a symbolic description of the propensity score model to be fit with the treatment indicator on the left side of the formula and the potential confounding variables on the right side.

data
A dataset that includes the treatment indicator as well as the potential confounding variables.

n.trees
Number of gbm iterations passed on to gbm. Default: 10000.

interaction.depth
A positive integer denoting the tree depth used in gradient boosting. Default: 3.

shrinkage
A numeric value between 0 and 1 denoting the learning rate. See gbm for more details. Default: 0.01.

bag.fraction
A numeric value between 0 and 1 denoting the fraction of the observations randomly selected in each iteration of the gradient boosting algorithm to propose the next tree. See gbm for more details. Default: 1.0.

n.minobsinnode
An integer specifying the minimum number of observations in the terminal nodes of the trees used in the gradient boosting. See gbm for more details. Default: 10.

perm.test.iters
A non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%. Default: 0.

print.level
The amount of detail to print to the screen. Default: 2.

verbose
If TRUE, lots of information will be printed to monitor the the progress of the fitting. Default: TRUE.

estimand
"ATE" (average treatment effect) or "ATT" (average treatment effect on the treated): the causal effect of interest. ATE estimates the change in the outcome if the treatment were applied to the entire population versus if the control were applied to the entire population. ATT estimates the analogous effect, averaging only over the treated population. Default: "ATE".

stop.method
A method or methods of measuring and summarizing balance across pretreatment variables. Current options are ks.mean, ks.max, es.mean, and es.max. ks refers to the Kolmogorov-Smirnov statistic and es refers to standardized effect size. These are summarized across the pretreatment variables by either the maximum (.max) or the mean (.mean). Default: c("ks.mean", "es.mean").

sampw
Optional sampling weights.

version
"gbm", "xgboost", or "legacy", indicating which version of the twang package to use.

• "gbm" uses gradient boosting from the gbm package,
• "xgboost" uses gradient boosting from the xgboost package, and
• "legacy" uses the prior implementation of the ps function.

Default: "gbm".

ks.exact
NULL or a logical indicating whether the Kolmogorov-Smirnov p-value should be based on an approximation of exact distribution from an unweighted two-sample Kolmogorov-Smirnov test. If NULL, the approximation based on the exact distribution is computed if the product of the effective sample sizes is less than 10,000. Otherwise, an approximation based on the asymptotic distribution is used. **Warning:** setting ks.exact = TRUE will add substantial computation time for larger sample sizes. Default: NULL.

n.keep
A numeric variable indicating the algorithm should only consider every n.keepth iteration of the propensity score model and optimize balance over this set instead of all iterations. Default: 1.

n.grid
A numeric variable that sets the grid size for an initial search of the region most likely to minimize the stop.method. A value of n.grid=50 uses a 50 point grid from 1:n.trees. It finds the minimum, say at grid point 35. It then looks for the actual minimum between grid points 34 and 36. If specified with n.keep>1, n.grid corresponds to a grid of points on the kept iterations as defined by n.keep. Default: 25.

keep.data
A logical variable indicating whether or not the data is saved in the resulting ps object. Default: TRUE.

... Additional arguments that are passed to ps function.

Details
For user more comfortable with the options of xgboost, the options for ps controlling the behavior of the gradient boosting algorithm can be specified using the xgboost naming scheme. This includes nrounds, max_depth, eta, and subsample. In addition, the list of parameters passed to xgboost can be specified with params.

Note that unlike earlier versions of 'twang', the plotting functions are no longer included in the ps function. See plot for details of the plots.

Value
Returns an object of class ps, a list containing

• gbm.obj The returned gbm or xgboost object.
• treat The vector of treatment indicators.
• treat.var The treatment variable.
• desc A list containing balance tables for each method selected in stop.methods. Includes a component for the unweighted analysis names “unw”. Each desc component includes a list with the following components
  – ess The effective sample size of the control group.
  – n.treat The number of subjects in the treatment group.
  – n.ctrl The number of subjects in the control group.
- max.es The largest effect size across the covariates.
- mean.es The mean absolute effect size.
- max.ks The largest KS statistic across the covariates.
- mean.ks The average KS statistic across the covariates.
- bal.tab a (potentially large) table summarizing the quality of the weights for equalizing
  the distribution of features across the two groups. This table is best extracted using the
  \texttt{\texttt{bal.table}} method. See the help for \texttt{\texttt{bal.table}} for details on the table’s contents.
- n.trees The estimated optimal number of gradient boosted iterations to optimize the loss
  function for the associated \texttt{stop.methods}.
- ps a data frame containing the estimated propensity scores. Each column is associated
  with one of the methods selected in \texttt{stop.methods}.
- w a data frame containing the propensity score weights. Each column is associated with
  one of the methods selected in \texttt{stop.methods}. If sampling weights are given then these
  are incorporated into these weights.
- estimand The estimand of interest (ATT or ATE).

- datestamp Records the date of the analysis.
- parameters Saves the \texttt{ps} call.
- alerts Text containing any warnings accumulated during the estimation.
- iters A sequence of iterations used in the GBM fits used by \texttt{plot} function.
- balance The balance measures for the pretreatment covariates used in plotting, with a column
  for each \texttt{stop.method}.
- balance.ks The KS balance measures for the pretreatment covariates used in plotting, with a
  column for each covariate.
- balance.es The standard differences for the pretreatment covariates used in plotting, with a
  column for each covariate.
- ks The KS balance measures for the pretreatment covariates on a finer grid, with a column for
  each covariate.
- es The standard differences for the pretreatment covariates on a finer grid, with a column for
  each covariate.
- n.trees Maximum number of trees considered in GBM fit.
- data Data as specified in the \texttt{data} argument.

Description

Simulated example data for assessing race bias in traffic stop outcomes

Usage

data(raceprofiling)

Format

A data frame with 5000 observations on the following 10 variables.

- id: an ID for each traffic stop
- nhood: a factor indicating the neighborhood in which the stop occurred.
- reason: The reason for the stop, mechanical/registration violations, dangerous moving violation, non-dangerous moving violation
- resident: an indicator whether the driver is a resident of the city
- age: driver’s age
- male: an indicator whether the driver was male
- race: the race of the driver, with levels A, B, H, W
- hour: the hour of the stop (24-hour clock)
- month: and ordered factor indicating in which month the stop took place
- citation: an indicator of whether the driver received a citation

Source

This is simulated data to demonstrate how to use twang to adjust estimates of racial bias for important factors. This dataset does not represent real data from any real law enforcement agency.

References

Examples

data(raceprofiling)

# the first five lines of the dataset
raceprofiling[1:5,]
sensitivity | Function to run sensitivity analysis described in Ridgeway's paper; currently works only for ATT.

Description

Performs the sensitivity analyses described in Ridgeway (2006). This is a beta version of this functionality. Please let the developers know if you have problems with it.

Usage

sensitivity(ps1, data, outcome, order.by.importance = TRUE, verbose = TRUE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ps1</td>
<td>A 'ps' object.</td>
</tr>
<tr>
<td>data</td>
<td>The dataset including the outcomes</td>
</tr>
<tr>
<td>outcome</td>
<td>The outcome of interest.</td>
</tr>
<tr>
<td>order.by.importance</td>
<td>Orders the output by relative importance of covariates.</td>
</tr>
<tr>
<td>verbose</td>
<td>If 'TRUE', extra information will be printed.</td>
</tr>
</tbody>
</table>

Value

Returns the following
* 'tx' Summary for treated observations.
* ‘ctrl’ Summary for control observations.

References

stop.methods | Stop methods (e.g. "es.mean", "ks.mean", etc.) object, used only for backward compatibility

Description

In older versions of twang, the ‘ps’ function specified the ‘stop.method’ in a different manner. This ‘stop.methods’ object is used to ensure backward compatibility; new twang users should not make use of it.

Usage

stop.methods
Summary

Format

An object of class matrix (inherits from array) with 1 rows and 6 columns.

Details

This is merely a vector with the names of the stopping rules.

## S3 method for class 'iptw'

summary(object, ...)

Arguments

object An iptw object.

... Additional arguments.

Details

Compresses the information in the desc component of the iptw object into a short summary table describing the size of the dataset and the quality of the propensity score weights.

Value

See iptw for details on the returned table.

## S3 method for class 'mnps'
summary(object, ...)
```

**Arguments**
- `object` An mnps object.
- `...` Additional arguments.

**Details**
Compresses the information in the desc component of the mnps object into a short summary table describing the size of the dataset and the quality of the propensity score weights.

**Value**
See `mnps` for details on the returned table.

**See Also**
- `mnps`
**summary.ps**  
*Summarize a ps object*

**Description**
Computes summary information about a stored ps object

**Usage**
```r
## S3 method for class 'ps'
summary(object, ...)
```

**Arguments**
- `object`: An ps object.
- `...`: Additional arguments.

**Details**
Compresses the information in the desc component of the ps object into a short summary table describing the size of the dataset and the quality of the propensity score weights.

**Value**
See `ps` for details on the returned table.

**See Also**
- `ps`
